

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + Refrain from automated querying Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + Keep it legal Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

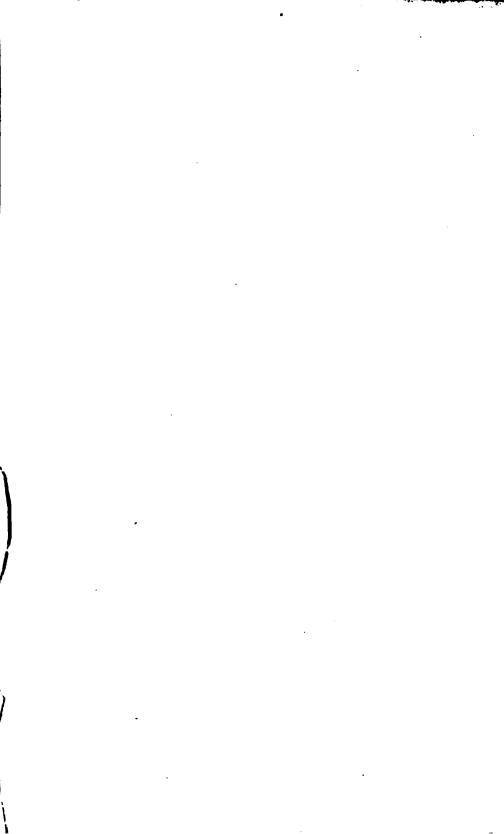

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at http://books.google.com/

Where there is a waste of water a proper increase of rates will be made.

REPORT

OF THE

BOARD OF WATER COMMISSIONERS

OF THE

CITY OF DETROIT.

WATER COMMISSIONERS' OFFICE.

DETROIT, January 19, 1892.

To the Common Council of the City of Detroit:

The Board of Water Commissioners respectfully submits its annual report for the year ending December 31, 1891.

A detailed statement has already been presented by the Secretary to your honorable body, showing the entire expenditures of the Board during the year. This statement gives the number of the voucher upon which the payment is made, the name or names of those to whom it is paid, the service or material paid for, and the payment itself.

The bonded indebtedness of the Board is \$1,229,000, upon which is an annual interest of \$76,610.

One hundred and forty-six thousand dollars of these bonds will fall due August 1, 1893, and there will be in the sinking fund at that time about \$75,000, the accumulated surplus from the general tax levy, to assist in their redemption, leaving only \$71,000 to be taken from the general fund.

The total expenditures of the Board were \$508,255.20, and the receipts were \$492,457.45, an excess of the former over the latter of \$15,797.75.

During the last two years the Board have been called upon to expend a much larger sum than is usual in the extension of its pipeage system.

In 1890, the Board, as already reported, laid a considerable amount of its larger sized supply mains throughout the central and business portions of the city.

During the past year, the large annex to the city caused the laying of pipe through much of this new territory, the laying of a large supply main up Collins from Fremont street to the Boulevard, thence west to Grand River avenue; also a large main out Woodward to the new city limits. The expense for iron pipe alone the last two years was \$538,270.43.

The expense during the ensuing year in this direction will by no means be as great. The total amount of pipe laid during the year was over 43 miles, double that of any previous year, excepting that of 1890, when it was over 25 miles.

During the year the Board determined to discontinue the use of the settling basin at the pumping works, long enough at least to pump the water therefrom and inspect its condition.

As soon as the water was drawn out, the entire Board visited the works and carefully inspected the basin, and the character and quantity of the deposits that had accumulated therein.

Much to the surprise of the Board there was nothing there of an offensive nature, or that indicated any appreciable accumulation of organic matter.

It had served, however, a valuable purpose in causing the precipitation of earth or sand, of which there was an accumulation of about one and one-half feet, since its construction fifteen years ago.

It also causes the precipitation of grass or weeds that is carried along in the water, and which during the year is constantly being raked up and carried away by men employed for that purpose.

The water was ordered to be let into the basin again and the Superintendent of Construction instructed to submit to the Board, at some future day, some simple and practicable plan for a permanent renewal of the west wall of the basin and the dock along the same, which is now in a very dilapidated condition.

During the past year the Board has had, what is called "Inlet pipe No. 1," taken up, relaid, and extended 500 feet further into the river. A conduit of brick, 200 feet in length, was built from the basin to connect with this inlet pipe.

The cost of the former work was \$11,020.47, and that of the latter \$9,524.39.

During the past year the Board deemed it advisable, thinking it could reduce its income to that extent, to remove the assessments on hose used for street and lawn sprinkling. The total assessments on hose, then upon the books, amounted to \$20,000.

The result was that a great many purchased and used hose that had not done so before, and those who already had hose seemed to use them more lavishly than ever before. Eight million gallons of water was pumped on an average each day into the city to supply this use alone, some days or portions of days, the engines were pumping at the rate of between fifty and sixty million gallons of water, the extreme limit of our capacity to supply.

The Secretary recommends that certain restrictions be made that will prevent such extravagant use, and it may be advisable to adopt something of this nature, rather than enter into a large expense to increase our pumping facilities, as urged by the Engineer, simply to supply this demand and no other, as the total quantity pumped each year is steadily and surely decreasing.

There has been quite recently considerable discussion in the papers and among manufacturers and business men, in regard to the water rates of the Board, and considerable feeling has been displayed, and wrong impressions created in this discussion.

In the first place there seemed to be a lamentable ignorance as to what the rates for water really were, and some of our manufacturers have denounced the rates as oppressive, and cited in proof thereof that the excessive charges for water had forced them to go to considerable expense to put in a plant of their own rather than submit to the burden imposed upon them.

Each of these cases took place at a time when the rates of the Board were three times larger than they are to-day, and yet no indication was given of any approval or even knowledge of such a large reduction, and yet which should have been a matter of common information.

It was frequently charged that water rates were less in Chicago, Toledo, Cleveland, Philadelphia and Baltimore, when in fact every one of the foregoing cities charges at least double and some three and four times as much as the rates in Detroit.

We instructed our Secretary to procure the rates of all the prominent cities and have them published in the daily papers, which was done, and which had the effect of stopping almost entirely this unreasonable hue and cry.

In our report to your honorable body, written two years ago, these words were used: "The Board have carefully considered the subject of meter rates, and being impressed with the idea that the manufacturing and husiness interests of the city, upon which we depend largely for our common prosperity, should be protected and conserved as far as it was reasonable and just, at a special meeting in September (1889) made a reduction of 33½ per cent, in its rates. Ind we desire further to say, that should it be at any time in the future demonstrated to us that a further reduction can be made, we will cheerfully and gladly comply therewith."

We recall these words simply to show our fellow citizens that, long before the present agitation of this subject, the Board of Water Commissioners were giving this very matter careful study, and have been aiming ever since to give to the people of Detroit, that which is demanded to-day, "cheap water." And we have accomplished it too, to a certain extent; for in less than two years the water rates have been reduced to out-third of what they were.

Unjust and unreasonable criticism from our fellow citizens, whom we are serving, with the only compensation therefor but the hope and the wish to so execute the great trust reposed in us as to best conserve their true interests, is certainly not pleasant nor is it merited.

His Honor, the Mayor, in his annual message to your honorable body, speaks of the old fogyism of the past in connection with the fact of the laying of wooden pipe several years ago, and which your present Board is now replacing with iron. Is it not true in all other matters as well as in this, in private and public life, that in advancing along the line of thought and enterprise that the wisdom of yesterday is the old fogyism of to-day, and the wisdom of to-day will be the old fogyism of to-morrow? "The evils that men do live after them, but the good is often interred with their bones." Let us not be ungrateful to the men who have passed away, nor too critical of those labors that were undoubtedly performed with all the wisdom of their time.

His Honor, the Mayor, also says that he fears that the Board is erring some in investing so much in meters, and says that an engine of almost unlimited capacity could be purchased for the amount invested in these appliances.

If it had been a question of purchasing an engine only, your Commissioners would not have hesitated a moment.

The cost of a pumping engine is but a tithe of the expenditures required to keep pace with an ever increasing consumption and waste.

To illustrate our meaning, your attention is invited to the following statement:

YEARS.	FAMILIES SUPPLIED.	WATER PUMPED.	PER FAMILY.
1868	11,554	1,666,545,125	144,239
1878	20,608	4,345,743,330	210,927
1888	36,863	14,380,166,670	390,094
1891	43,983	12,057,261,286	273,080

The first three lines illustrate how much more rapidly consumption increases than the population, when there is an unrestricted use. The last line shows what the meters have accomplished, in not only stopping the growing percentage, but also in largely reducing it. Now let us state another fact, and that is that the cost of running the water department of any city,

depends largely upon the quantity of water which the works are called upon to supply. If the supply can be reduced, so can the cost. If the cost can be reduced, so can the rates for water, and that precisely is what your Commissioners are doing to-day.

In continuation of this question of an outlay that was required in the spring of 1889, let us take a pencil and put down a few items. It was estimated at that time that the expense of another engine, another large supply main from the works to the city, which by the way is needed more than an engine, a new engine house, etc., would have cost the Board \$600,000.

Now the interest upon this amount for three years would have been a necessary expense, and at 4 per cent. per annum, would have amounted to \$72,000. The increased operating expenses would have been at least \$30,000 more, making a total of \$102,000.

Now the expense actually incurred was for meters in 1889, \$13,644.41, the interest upon which for three years was \$1,637.32; for meters in 1890, \$30,601.68, the interest upon which for two years was \$2,448.13, and for meters in 1891, \$12,413.14, upon which the interest for one year would have been \$496.52. The total for the three years' operations then was \$4,581.97.

We have given the entire expense of this department, Superintendent and repairs included, but have not made any calculations on the depreciation of the values of the meters, neither did we make any calculations on the depreciated valuations of the construction contemplated, which would have been much more.

Now what do we have as a result of our calculations? An expense of \$4,581.97 has saved an expense to the city of \$102,000, and which expense ever increasing and expanding would have been fastened on us for all time to come.

In conclusion we have to say that we do not ask for blind confidence, nor do we wish to be blindly and unreasonably criticized, but we do ask our fellow citizens to judge us by the facts, and that our efforts to serve the whole people irrespective of class or calling be properly appreciated.

It would not be proper for us to enter into the discussion as to whether the works should be self supporting or not, that is a question to be decided by your honorable body, but that it has been so far, is a matter of pride and approval with many of our citizens, and is a condition that every other city in the United States is striving to attain.

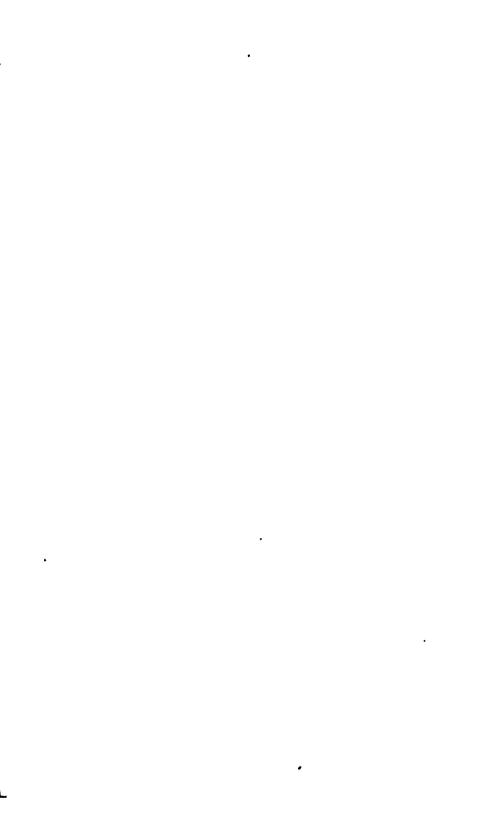

We point to our operating expenses with a just pride, inasmuch as it has no equal, even among those cities whose facilities for obtaining water are as good as they are in Detroit.

We respectfully refer you to the accompanying reports of the Secretary and the several heads of departments.

All of which is respectfully submitted.

HENRY M. DUFFIELD, AUGUST GOEBEL, S. G. CASKEY, J. L. HUDSON, FRANK E. KIRBY.

Commissioners.

REPORT OF THE SECRETARY.

Report of the Secretary.

DETROIT, January 2d, 1892.

To the Board of Water Commissioners:

GENTLEMEN:—I have the honor to submit the Secretary's report of the general operations of the Works during the past year, as well as a complete resume of its financial transactions.

I have been impressed with the desire of the Board to render the Works as complete and perfect in its operations as possible, and to that end have introduced into its various departments such disciplinary regulations as seemed to me necessary.

I have also given careful heed to the various complaints that have been made to me, in regard to "short supplies" and "impure water." These complaints have been in every case thoroughly investigated, and as a result I soon became aware that certain portions of the city were supplied with a much larger head than was necessary, and certain other portions with a considerably smaller head than the mechanical and household purposes, or uses, actually required.

In order to arrive at a correct knowledge of these heads or pressures, I had placed, through the courtesy of the Fire Department, pressure gauges in various of their engine houses, and a record has been kept ever since of the pressures at each place every hour in the day.

These gauges in the month of July, which was the first month they were in operation, showed the following facts:

16	THE PARTY	Times of the control	ELFERTS OF
केल्याका प्राथ में एवं ज्ञात	# #1 - mr	# # ~~	NI N freet

Rose and History	>	14 -4	★ → · · ·
Proceeding the state of	-	14 TH	4 30 .

Upon making a strip of this table, it will be readily seen that a religion the general elevation of water throughout the city is grain also the same, yet the relevation above the grain, it is second column to us a great disparity, being an tile way from 2 to 62 feet.

An equality is not the pressures through the city is the orly interest matter in this regard, and it therefore became a end you will normally be partially an implished by the partial covering of given in pipes leading to the districts where the pressure was unnecessarily large, and by laying a few lines of larger early you as to such districts as had a very low pressure. The considered discrete a certain extent, and while the evil has there had part a youred, yet one thing, and a very important one, has been a complished, and that is, not a single complaint has been made of a lose pressure in the last three months.

IMPURITIES IN THE WATER.

These have been found, upon investigation, to consist almost every of sand or earth, and grass, and would naturally lead to the conclusion that sedimentation, or precipitation, is not ac-

complished to any great extent by the use of the settling basin at the Pumping Works. This conclusion was sustained by the condition in which the basin was found on the 6th of last November, when the water was pumped out and inspected by the Board. Your honorable body has at various times considered the question of constructing a new settling basin, but have concluded not to do so, I believe, because the expense would be much greater than any good to be attained thereby. The question has occurred to me as to whether the water could not be more thoroughly strained before pumping it into the city than is now accomplished by the strainer at the ends of the inlet pipes, and in the gate wells. Soon after the pumping out of the basin I suggested to Supt. Bridge the plan of extending a strainer completely across the basin, the meshes or openings to be so fine as to force the whole surface of the strainer to be in use to allow the necessary quantity of water to pass. This would not only strain the water far more thoroughly than now, but would also accomplish more perfectly, what is sought for by the use of the bulk head, spreading the flow of water over the entire width of the basin. Mr. Bridge approved of the idea, and no doubt will recommend it to your attention.

PUMPING WORKS.

It will seen by the report of the Chief Engineer that less water was pumped than in the year previous, notwithstanding the rapid growth of the city. This indicates something of that which has been accomplished in still further reducing the waste, though not entirely. The action of the Board in removing the charge upon hose used for street and lawn sprinkling, had the effect of almost if not quite doubling the number of hose in use, and also causing a more lavish and extravagant use of the same. A comparison between the quantity pumped in November and December, and that of July and August, will give some idea of the immense quantity used for sprinkling. The average pumped in November daily was 28,755,869, and that in December 30,113,603; while that of July was 37,020,418, and

that of August 39,141,427. It will be argued that the G. A. R. National Encampment in August largely increased the consumption, but this was not sufficient to any more than possibly increase the daily average for the month about one million. Deducting this and averaging the two months we find that there was pumped each day in July and August 8,000,000 gallons of water more than the average pumped in November and December.

While it was a sufficient sacrifice on the part of the Board to abate the charges for hose, which amounted in 1890 to \$20,000, it has been called upon to make that sacrifice greater by a recommendation of the engineer to purchase another engine simply to supply the exorbitant demand in the summer months. In Mr. Edwards's report he urges upon the Board the necessity of having increased facilities for pumping, notwithstanding the fact that the whole quantity that was pumped during the year was less than it has been in the last five years.

The following statement shows the amount of water pumped during the last six years:

1896	.10,576,571,254	gallons
1887	.13,168,859,808	**
1888	.14,380,166,670	44
1889	.12,875,334,453	. "
1890	.12,120,944,582	**
1891	.12,057,261,236	••

I consider that the generosity of the Board has been grossly abused, and I recommend that some radical restrictions be made in the use of the hose, either in regard to length of time of such use, or the time of day in which they will be permitted to be used.

I certainly am opposed to seeing the Board drawn into the expense of another engine, and which means another house, engineers, etc., when it is a fact that through the operations of the Board in stopping the waste, the work required at the pumping station is steadily decreasing, and has been since

1888, during which year the Board pumped over six million gallons daily more than was pumped last year.

Under the direction of the Committee on Pumping Works, I prepared the following rules for the government of the officers and men employed at the Works:

RULE I.

The Chief Engineer shall have charge of the Engine House, and all of the means and appliances constructed and used for supplying water to the city.

RULE II.

The First, Second and Third Assistant Engineers shall in turn, eight hours out of each twenty-four, have direct charge of the engines, boilers and other means used in pumping water, and the Engineers, firemen and other employees engaged in said work shall obey the orders of the Assistant in charge only.

All orders or instructions from the Chief Engineer must be given the men through the Assistant-in-charge, in order that there may be no confliction.

This rule not to apply in moments of extreme danger or peril when the Chief Engineer is present.

RULE III.

The Engineers and Firemen may be excused from duty in the discretion of the Chief Engineer, but the Assistants must in no case be absent from the Engine House during the hours they are in charge of the same, unless it be on a matter of grave importance to the Works, or in case of sickness to self or family.

RULE IV.

All the employees of the Pumping Works as aforesaid, with the exception of the Chief Engineer, shall give their services during the hours of the day arranged for them by the Chief Engineer. During the other hours of the day, as long as they conduct themselves in a decent lawful manner, they are independent citizens, and can do as they please, and live where they please, without reference to the Board or any of its Officers.

RULE V.

The telephone boy is employed by the Board for the sole purpose of minding the telephone, and such other duties as may be required of him, that will not cause him to absent himself from the vicinity of the telephone room. The Chief Engineer and the Superintendent of the grounds will keep him apprised of their locality during the hours of the day as fully as possible, in case they are called for.

RCLE VI.

The Superintendent of the grounds, as such, is subject only to orders from the Board, or their Secretary, as provided for in the Regulations of the Board. In his capacity as Assistant or Clerk to the Chief Engineer, he will be subject to the instructions of that official, and perform his duties as such, as he, the Chief Engineer, may direct.

RULE VII.

The watches of the three Assistants are arranged as follows:

First Assistant, - from 7 A. M. to 3 P. M. Second " - " 11 P. M. " 7 A. M. Third " 3 P. M. " 11 P. M.

This arrangement must not be changed without permission from the Office of the Board.

EXTENSION AND CONSTRUCTION.

As will be seen by the report of Mr. Bridge, Superintendent of this department, over 43 miles of iron pipe were laid during the past year.

The operations of the Board for the two past years in this respect, have been very extensive, making an additional pipeage of over 68 miles. The cost to the Board of the above extension was in 1890, \$258,165.65, and in 1891, \$280,104.78, or a total of \$538,270.43.

I am very happy to state that the extensions required in the ensuing year will by no means be so large, in fact, that not over one-half the amount of pipe contracted for, for the year 1891, will be necessary for 1892.

METERS AND METER RATES.

As will be seen by Superintendent Putnam's report, about 400 additional meters have been placed during the year. The work in this department has progressed in a careful, painstaking manner, and certainly merits the full approval of the Board. The introduction of meters in this city has necessarily required the greatest care and courtesy on the part of the Superintendent of that department and the employees under him; and from the fact that but little indignation or opposition has been expressed or felt at what some considered an unnecessary innovation, there can be no doubt as to the good conduct of this work.

His report is full of interesting details, and I respectfully invite your careful attention to it.

The continual good effect of the further introduction of meters can best be understood by a close inspection of the accompanying table.

The cost of maintenance appears by this statement to be much less than the preceding year, but is really due, almost entirely, to the fact that I have eliminated from the Operating Expenses certain items that have hitherto been included therein, but which do not properly belong there. Practically, this expense was about the same as that of 1890.

COMPARATIVE STATEMENT.

	1867.	. 1888.	1889.	1890.	. 1801.
Daily average consumption in gallons.	86,079,166	89,897,716	86,874,888	88, 906, 067	88,088,593

On the 22d of December last, under instructions from the Board, I prepared a statement for publication in the daily papers of the city, showing the cost of water when metered, in a number of the larger cities of the United States. This statement is included herewith, and is based upon the meter rates of the several cities named, and which are on file in this office.

Buffalo being the only city which has a meter rate for manufacturers less than that of Detroit, a comparative statement of certain conditions in the two cities is also attached. By an examination of these conditions, I think it is obvious that the meter rates in Detroit of 3½ cents per 1,000 gallons is much cheaper than at 3 cents in Buffalo; that is as far as the respective Water Works are concerned. Buffalo has to maintain only one-ninth as many meters as Detroit, and pumps, through this one-ninth, about four times as much water as Detroit does through its larger number, making the cost of maintenance in Buffalo as compared to that of Detroit of one to thirty-six. Buffalo also secures from the general tax levy \$25,000 more than Detroit.

COMPARATIVE STATEMENT.

	DETROIT.	BUTTALO,		DETROIT.	BUTTALO.
Number of meters January 1, 1991	\$	3	Rate per 1,000 gallons for same	8 cents.	81/4 centa.
Consumption through meters, gallons	686,944,766	1286, 944, 765 2, 234, 692, 300	Per capita supply, gallons, daily	351	
Meter rates, per 1,000 gallons	Bly cents.	3 centa.	Miles of pipe	8	908
Total collected from meters in 1890	\$87,87H.00	\$67,107.60	Number of service connections	40,851	188'09
Unmetered water, gallons	11,408,999,767	14,418,606,110	Received from general tax lovy	\$75,000.00	\$100,000.00
Received for same	\$200,600.73	\$40K, 344.06	Operating expenses	\$00,948.78	\$148,001.79

This comparative statement is made from the reports from both cities for the year 1890, and by consulting the table upon a foregoing page it will be seen the number of meters has increased in Detroit to 1,239, and the rate received for each 1,000 gallons of metered water is three and four-fifths (3 $\frac{1}{4}$) cents, and the rate for each 1,000 gallons unmetered water is three and one-tenth (3 $\frac{1}{10}$) cents.

In order to show the exact saving accomplished by the introduction of meters, your attention is invited to the following The first table shows the number of families in the city in the different years as shown, and the actual quantity of water pumped. By consulting the engineer's table it will be found that in the last three years it has cost \$4.50 on an average to pump one million gallons of water. In the second table is given the quantities of water that would have been pumped had the uses of water continued unrestricted as formerly. quantities are, of course, estimated, but so steadily and so systematic has been the increase in the amount pumped from year to year, that one cannot go far astray in estimating the quantity that would have been pumped under similar circumstances. According to these figures the actual money saved in pumping water alone exceeds the entire expense of purchasing and placing all the meters introduced by the Board by \$15,501.

Now the only fault that can possibly be found in these figures is in the *estimated* quantity of water pumped each family, but as the ratio of increase from 1878 to 1888 was simply carried along into the next three years, it does not seem that even this can be wrong. This is in addition to the enormous amount saved in interest as given in the Commissioner's report.

Now let us aggregate the saving. First the interest on the expenditure required to extend the Works, \$72,000, to which add the difference between the meters and the cost of pumping as above, \$15,501, and then add to this the value of the meters in operation, on hand, tools, etc., which amounts to \$50,187.49, and we have as a result of this "mistake" of the Board, the grand total, or saving of \$137,688.49 in three years.

PLUMBERS AND PLUMBING.

Upon the recommendation of Supt. Putnam and myself a resolution was adopted, by your honorable body, doing away with the practice of requiring a certificate from an examining board before a license was granted; also the issuing of two classes of licenses.

We both believe that the introduction of the above innovations has been productive of much good, but that the reasons for maintaining them longer are not commensurate with the trouble they cause, and the misunderstanding arising therefrom.

Hereafter licenses will be issued to master plumbers, as required by your regulations, to do all kinds and character of work, and their work carefully inspected, and every one held strictly in accordance with the requirements of the Board as to material and workmanship.

FINANCIAL STATEMENTS.

STATEMENT.

Cash on hand, January 1, 1891	\$109,838	10
Receipts for the year	492,457	45
		\$602,290 55
Expended in 1891	\$508,255	20
Cash on hand, January 1, 1892	94,085	85
		\$602,290 55

To the Honorable the Board of Water Commissioners of the City of Detroit:

GENTLEMEN — Under instructions from the Committee on Ways and Means, we have carefully examined the books and vouchers of the Water Works from January 1 to December 31, 1891, and find them correct.

Cash on hand in office	\$4,509	28
Commercial National Bank General Fund	64,920	50
Commercial National Bank Sinking Fund	24,605	63
Total	\$94,085	85

Respectfully submitted,

(Signed) DAVID R. PIERCE, JOHN HOSMER.

Expert Examiners.

The following table is the report of the assessment made in May and June, for the fiscal year commencing July 1, 1891:

The total number of families found in the city was 44,932, or an increase in one year of 2,782, which is an increase in the population of the city of 14,132.

In the column showing "Increase or Decrease," it is shown that the assessments were \$7,877 less than those of 1890, but in the next column it is shown that the assessments upon such places as were taken from the assessment rolls and metered, amounted to \$11,300. And when it is further considered that the Board abated the rate on hose, which on the rolls of 1890 amounted in round numbers to \$20,000, it will be seen that instead of being a loss there is an actual gain of \$23,423.

The following table shows the receipts for water rates during the year, arranged in districts, and giving the amounts collected upon each annual assessment.

The next to the last column shows the receipts for meter rates for the months of October, November and December only. The total receipts of meter rates during the year, were \$46,684.08.

Previous to October 1, meter rates were collected by the Assessors and Collecters, each in his own district, and are included in the collected rates as shown.

On the 1st of October, the Board created the office of Meter Clerk, and al the work of collection and the keeping of the records necessary to such work, is now imposed upon that official.

The total receipts are \$1,202.24 more than those of last year, notwithstanding a reduction in our meter rates and the hose abatement above referred to.

This showing is very gratifying, inasmuch as I had estimated that the reduction of the meter rates alone would be sufficient to cause the receipts for 1891 to be about the same as those of 1890.

RECEIPTS FOR WATER RATES, 1891.

YEAR	1885-6	1886-7	1887–8	1888-9	1889-90	1890-91	1891-2	Total

Total meter rates received during the year, was \$46,684.08.

The following table shows the whole history of the bonded indebtedness of the Board, in which it is seen that the total amount of bonds issued by the Board, is \$1,850,000, of which \$621,000 have been redeemed, leaving outstanding, \$1,229,000, upon which there is an annual interest of \$76,540.

None of these bonds were issued for the purpose of redeeming outstanding bonds falling due, but were paid from the net earnings of the Works, \$471,000 of them having been paid since the last issue of bonds.

In August, 1893, there will fall due, \$146,000, for which there will be in the sinking fund to assist in their redemption, about \$75,000, leaving but \$71,000 to be taken from the general fund.

The rapid growth of the city and its largely increased territory, obliged me to recommend to your honorable body the appointment of one additional Assessor and Collector, which was complied with to take effect in April next. P. J. Becker, so long in a position of trust and responsibility in the Western Union Telegraph Company, was selected by your honorable body, and will no doubt be an efficient and zealous official.

I have redistricted the city so that each Assessor will have two wards, and so arranged them that the assessment districts are, as nearly as possible, alike, as far as the work to be performed, is concerned.

They are arranged as follows:

TM-4-1-4	NT -	4 041 3 4541 T	T7 3	. D. T. D L
District	No	1—stn and loth t	v ara	sP. J. Becker

VALUATION OF THE WORKS.

The following is an inventory of the properties of the Board, as invoiced by the several heads of departments.

The valuations placed upon the real estate are those of W. S. Green, executor of the W. B. Wesson estate, whose opinion of real estate values is considered the best to be had.

In conclusion, I desire to express my appreciation of the courtesies that have been extended to us by the Fire Commissioners, the Board of Public Works and the Park Board and their several employees.

We are all striving to work harmoniously, and for the common good of the city; and during the past year, at least, I am confident that this disposition of the several Boards has been productive of much good.

All of which is respectfully submitted.

REPORT OF SUPERINTENDENT OF METERS AND INSPECTION.

Report of the Superintendent of Weters and Inspection.

DETROIT, January 2, 1892.

10 the Board of Water Commissioners:

GENTLEMEN—In compliance with the rules of your honorable body, I herewith report the work done in the meter and inspection departments during the year 1891.

The following tables show the number of meters placed during the year, and the total number in service on the 31st day of December, 1891:

As you will see by the foregoing tables, we have placed 373 meters during the last year. Adding therefo, 856 meters and 10 indicators previously placed, makes a total of 1239 meters and indicators in service on the 1st day of January, 1892.

There have not been as many meters placed during the last year as in the previous year, but in proportion to the 'number placed, the same gratifying results have been produced as formerly.

After metering the livery stables, laundries, breweries, saloons and manufacturing establishments, we were under the impression that we had stopped the largest source of waste, but such has proven not to be the case. It seems to make no difference where we go, the same careless waste of water confronts us. Latterly we have been metering the principal stores in the central part of the city, and in a majority of them, the waste is very large, principally in the closets and urinals where the disposition seems to be never to shut them off, and in a great many cases they could not be shut even though the occupant was disposed to do so, as the plumbing is so defective.

Another source of great waste is in the tank elevators. Instead of the water being used over and over, as is supposed, through neglect, the automatic valves have become useless, thereby allowing a continuous flow of water, as there are no means of knowing when the tanks are full, the overflow passing directly into the sewer. In several instances, we have found them using 20,000 cubic feet per month, where it was supposed not 20 feet was being consumed.

It is surprising to find the great difference in the consumption of water by those in the same line of business. For instance, one drug store consumed 500 cubic feet in one month, while another of about the same size consumed 28,000 cubic feet. The first was formerly assessed at \$15,000 per year, and the latter \$20,000. Acron, a block of offices formerly assessed at \$182,000, consumed daring the last year, 554,000 cubic feet, for which they paid \$14700, while another block somewhat smaller and with the same last of to nants on with the assessment was \$150,000, consumed \$150,000 cubic feet, for which they paid \$285,000, shows

ing a great waste in the latter, of which the owner was notified on several occasions. He finally concluded it was worth while to investigate the plumbing, and, if necessary, repair it. In doing so he has reduced the consumption from about 100,000 cubic feet to 23,000 cubic feet per month, and is now wondering why he did not give it attention before.

A merchant, who is a great advocate of the meter system, and whose assessment was \$36.00 per year, wanted his premises metered. He was very careful of the water, allowing no waste whatever, and expected to save money by being metered. The first month's consumption was 38,000 cubic feet, cost, \$10.42; second month, 13,800 cubic feet, cost, \$4.20; third month, 7,400 cubic feet, cost, \$2.60; and he expects to reduce it still more the present month, all of which goes to show how little attention is paid to the waste of water until a meter is placed on the premises.

There are very few who object to being metered. Occasionally a strong protest is made, and when it is we suspect bad plumbing the cause, and the meter proves us right in almost every instance. About the strongest protest against the meter came from an unexpected source, the leading spirit in one of our gas companies. He would not allow a meter to be placed on his premises, claiming that the use of water was so small that it would be a useless expense, as the only use was for drinking purposes and closets. No steam for elevator or heating. However, we placed a meter in the ground outside of the premises—as he would not allow us to go inside—and the first month showed a consumption of 33,500 cubic feet, cost, \$9.14; and on presenting the bill were surprised to see what little faith he had in the accuracy of the meter. was positive it was wrong, but decided to let it go for another month before fully condemning it. The second month showed a consumption of 40,400 cubic feet, cost, \$10.85, and when he saw the bill, there was no question in his mind of the worthlessness of the meter, claiming that he had self-closing faucets on all openings, and there was absolutely no waste, and he wanted the meter removed. He almost convinced us that the meter was at fault, but it seemed to be working all right, and reading it daily

showed that about 1,200 cubic feet were going somewhere, and on making a thorough examination of the premises, found all fixtures in good condition with the exception of some old style panclosets which had been overlooked in making their repairs, and where the whole trouble lay. After having them changed to tank closets, the consumption has been reduced from 40,400 cubic feet to 3,200 cubic feet, the cost of which is \$1.55. The meter has not been changed, but remains there fully vindicated as to its truthfulness.

After such instances as the foregoing (and there are many of them), one would think there ought not to be any objection to the meter, for it simply records the amount consumed and for which the consumer should pay.

INSPECTION.

The system of making a house to house inspection twice each year has been rigidly kept up, and in doing so, have found it necessary to employ five examiners, who have in addition to their regular duties, read the meters and delivered the meter bills each month, which has taken about one-quarter of their time.

They have made 71,919 examinations. It requires two, and sometimes three calls to each house where a leak is discovered. The occupant is given a stated time to have it repaired, a second call is made and in some cases (where the owner or occupant is in poor circumstances) more time is given, requiring a third call to see if the necessary repairs have been made. After the expiration of the time given, if the notice has not been complied with, the water is slut off.

There have been 8,436 leaks reported, of which 3,115 were repaired and 811 ordered shut off until such repairs were made. A large proportion of the leaks were small, caused by the packing in the b b being worn out, a defect which is very easily and promptly repaired. In some instances the water is found removed this bead with evidence of it being willing at the same time the occupant of timing it to be accidental, and there seems

to be only one way to effectually stop the waste in such cases, and that is the meter. Otherwise as soon as the examiner is out of sight the water is running again, and the same excuse follows, but when a meter is placed on the premises it is surprising to see the effect it has on their memory. They seldom forget to stop the water when not in use.

I am pleased to say there has been a marked improvement in the plumbing during the last year. The plumbers generally have complied with our rules and regulations quite satisfactorily. Some ill feeling was caused by issuing a first and second class license. As I said to you in my communication of December 30, recommending the abolishment of the system, it was next to impossible to draw the line between a first and second class plumber. None would admit of their being second class workmen, and in nearly every case wanted a first class license. They claimed—and I think justly—that, as we had rules and regulations governing them, and also Inspectors to examine their work, if it was not done in a satisfactory manner they were compelled to change it, and after doing so the Water Board ought not to ask anything more. The very fact of them having to change their work, if not properly done, makes them very careful indeed, as to undo a portion or all of their work interferes largely with their profits, and of course, a plumber does not like to have anything of that kind occur.

In doing away with the second class and giving all plumbers a license, then holding them to a rigid compliance with our rules will be much more satisfactory to the plumbers generally and we will arrive at as good results as formerly. The foregoing change does away with the necessity of the Examining Board of Plumbers. The fact that they do their work to the satisfaction of the Water Board shows their capability of doing first class work, and as that is the point we have been trying to arrive at nothing further can be gained, and for that reason I recommended its discontinuance.

The following table shows the work of the Examiners in the eastern and western divisions:

	EXAMINATIONS.	LEARS REPORTED.	LEARS REPAIRED.	ORDERED SHUT OFF.
East Woodward Ave.	86,040	1,758	1,640	118
West "	85,989	1,688	1,475	208
TOTAL	71,979	8,436	8,115	821

The following table shows the duties performed by the Inspectors of new work:

	Calls for Non-payment.	Shut for Non-payment.	Examined New Connections.	Examined Exten's and Fixtures.	Let on New Connections	Notified for Building Tax.	Shut for Vacancy.
John Wallace	405	181	710	174	663	5 0 ,	190

Youal	3,550	2,187	3,301	777	2 ,611	366	421

Attached to this report is a complete list of tools on hand, and an itemized account of the material in stock on the 31st day of December, 1891.

Before closing this report I want to thank the Board for their uniform kindness in the past, and also the Secretary for his very courteous treatment at all times. When any complications have arisen I have consulted him, and owing to his good judgment and convincing arguments, together with the active interest taken in the meter system, we have moved along with the least possible fraction in our department.

All of which is respectfully submitted.

T. R. PUTNAM,

Report of Superintendent of Grounds.

To the Honorable Board of Water Commissioners:

Gentlemen—In accordance with the regulations of the Board I respectfully submit to your honorable body my report of the work performed upon the grounds at the pumping works, together with such recommendations in regard to future operations as seem to me wise for the coming year.

The work performed has of course been almost entirely of a routine nature, as it has been the wish of the Board, on account of the unsettled condition of the Hurlbut legacy, to keep the grounds from deteriorating rather than to make any general improvements.

The strip along the east line fence south of the engine house, through which the new inlet was laid in 1890, has settled firmly, and we have leveled it to the proper grade and sown grass seed, and expect a fine greensward by June 1st.

About one acre in the northeast corner of the grounds became badly covered with quack grass and weeds, although careful and continual attention was given to prevent such growth.

The only remedy left was to plough the piece, harrow well, and sow grass seed, which was done.

Along the west side of the canal is a strip that is so covered with thistles and weeds that I would advise ploughing it in the spring, and sowing oats and seeding clover, as oats are of value to the Board. With the permission of your honorable body I will carry out this plan upon the opening of spring.

Acting under instruction from your Committee on Pumping Works, about the middle of July I worked out the floral design, "Welcome G. A. R., 1891," in the plat of grass near the engine house. Owing to continual cool weather the plants were

not at their best during G. A. R. week, but were, I think, equal to anything of the kind in the city.

We have utilized the engine house gallery to keep the plants through the winter, but I am sorry to say that they are not doing very well, although a steam pipe has been laid, and the temperature thereby preserved in an equable condition. There seems to be other reasons why the plants do not do well, one is I think the atmosphere is too dry, and another that there is not sufficient light; however, I hope to save most of them, as it is my intention to make a few flower beds in the spring, but of course we can not expect very satisfactory results until we have a proper green-house.

I have been instructed by your committee to inquire as to the probable cost, method of heating, etc., of a green-house, suitable for our present use; and I would respectfully report that I have inspected several green-houses in the city, and am of the opinion that three hundred and fifty dollars would cover cost, aside from facilities for heating, which would cost about one hundred and fifty dollars for piping, if you should conclude to use live steam from our boilers.

In giving the estimate of the cost of a green-house I have done so under the idea that I may control the construction of the same, after the plan thereof has been approved by the Board, and that I be permitted to purchase the material therefor, and have the same erected by days' labor.

Last year I recommended placing a new iron fence along the Jefferson avenue front, also laying sewer crock, and filling in the road ditch. These improvements would add very much to the general appearance, and I hope your honorable Board will doe in it expedient to have these improvements made during the ensaing year.

In correlation, there is a matter that is giving me considerable uncasiness, and that is the contemplated widening of Jefferson arenue, and the evident prevailing alea that the said additional with be taken from the property upon the south side of the are at

Sound this like be adopted the results to the grounds would

be very unfortunate, as the row of maples immediately along the Jefferson Avenue line, which were originally set out to conform with a general plan of ornamentation, and which are now about twenty years old and in a very flourishing condition, would have to be cut down or removed back farther at a considerable expense, and probably a loss of some of the trees. I have thought it best to call the attention of the Board to this, what appears to me, a very grave matter, in order that they may be fully apprised of such contemplated action, and oppose the same should they deem it wise to do so.

Accompanying this is a report of expenditures and inventory of tools and material on hand in this department.

Respectfully submitted.

E. A. SCRIBNER, Superintendent of Grounds.

REPORT OF THE CHIEF ENGINEER AT PUMPING WORKS.

Report of Chief Engineer at Pumping Works.

DETROIT, January 1, 1892.

To the Board of Water Commissioners:

GENTLEMEN — I have the honor to submit the Engineer's report for the year 1891.

The following table shows the number of gallons of water pumped, and cost of fuel for the years named:

Cost per million gallons, \$4.39 $\frac{1}{16}$. Engines One and Two were run part of time with only one pump attached.

In figuring the duty in foot pounds, I have taken the total cost for fuel and reduced the same to coal, at \$4.25 per ton.

By referring to the tables you will notice the daily average is 33,033,592 gallons, which is less than the average last year. This showing is remarkable considering the number of miles of new mains laid in the annexed territory, supplying 3,301 additional consumers. It is very evident that as the meter system is extended, the waste of water becomes less, and is proving a great benefit to the city, not only in reducing the expense of additional pumping facilities and water mains, but is making it possible to furnish a better head of water. This alone ought to satisfy the citizens of the wisdom of adopting the meter system.

I doubt that the present low water rate would have met our running expenses, if the meter system had not been adopted. You will notice our cost for fuel is more than in 1890; this may be accounted for by the better head furnished. The water in the river has been lower than ever before, and we have raised it a greater heighth than any year since I have been connected with the Water Works. Every additional inch the water is elevated adds to the cost.

I am glad to report that the engines are in good order, although hardly any repairs to either of them have been made the past year. You will see the duty shows rather lower than former years. The reason of this is the numerous changes from coal to gas, and vice versa. A great many times the pressure on the gas gauge would show very little gas, and for fear of complete failure, and for safety, we would start fires in the four coal boilers. By the time the coal boilers began to make steam the gas would come to usual pressure and of course the coal would be consumed making a great waste of fuel, which counts against the duty of the engines.

The four boilers in the west boiler room have been in almost constant use for nearly fifteen years and of course the plates are somewhat weaker although as soon as any defect shows I have had the same repaired immediately in the best possible manner. The boilers in the east boiler room have been in use

about ten years, and have had some repairs and are now in very fair order. When it becomes necessary to have new boilers I would suggest bushing the high steam cylinders in the three engines so that we could carry about 125 or 130 pounds pressure; we would get greater benefit from expansion, as the expense of evaporating 130 pounds of steam does not cost in the same ratio as the first fifty or sixty pounds.

I do not hesitate to say, with higher steam and the engines bushed as I have suggested, they would do a duty of 100,000,-000 foot pounds. As to the wisdom of this proposed change, I would respectfully refer to Commissioner Kirby as he will readily understand these poinst. Of course none of these suggestions could be carried out until a new engine was erected, and I now urge, as I have heretofore, the necessity for another engine, as I am satisfied during next summer we will need to run all three engines to supply the demand for at least four hours daily while there are thousands of hose running full The demand for water is so very irregular; through the day we may be pumping at the rate of thirty-five million up to about four o'clock; from then until 8.30 we would be pumping at the rate of fifty to sixty millions; after that time we keep checking down and run as slow as possible. So you can see that as we have boilers enough through the day we have more than enough through the night. Although the boilers may be banked or the fire checked down, the fuel is being consumed without the engines getting any credit for duty.

You will bear in mind that the reserve engine serves as a reservoir, but if while we are depending so much on this engine, one of the engines should become disabled, which may happen any time, you can readily see the city would be with a short supply, and I do not think it wise to take this risk. The past year has been a very favorable one for the Pumping Works, as hardly a week passed without a shower of rain. If the time for the use of hose was limited to morning and evening, it would be a great advantage to us and the citizens would not be inconvenienced. This rule is in force in other cities and why not in Detroit?

I have lately visited all the large manufacturers in the city that are using crude oil for fuel, and I find it to be a very satisfactory fuel, all users speaking in the highest terms of it. With good combustion the heat is distributed very evenly on the boilers, and I venture to say 30 to 40 per cent. cheaper than coal or natural gas, and I would recommend having the necessary fixtures put into the four boilers in the east boiler room.

I can see no economy in gas over coal, and experience teaches us that we run a great risk of short supply, as has happened several times during the year, as I have before mentioned. It is a very clean fuel and easy to control, but I can not recommend its continual use.

I am thankful to the Board for having adopted new rules governing the employees, and especially that of having three assistants, either of whom have full charge during my absence. These assistants have eight hour watches and are held responsible, and as I have every confidence in them, I am relieved of considerable anxiety and care.

I am also glad to report that the employees are faithful in the performance of their duties, and the orders of the Board are obeyed to the very letter. The utmost satisfaction prevails throughout this department.

Respectfully submitted.

JOHN E. EDWARDS.

Engineer.

REPORT OF THE SUPERINTENDENT OF EXTENSION AND CONSTRUCTION.

Report of the Superintendent of Extension and Construction.

DETROIT, January 2d, 1892.

To the Board of Water Commissioners:

GENTLEMEN—In accordance with the regulations of your Honorable Body, I have the honor to present my annual report relative to the general condition and progress of the work in this department.

This has been another year of very large extensions to our pipeage system, one of the largest on record, over 43 miles of pipe having been laid.

At the commencement of the year we had anticipated but a small outlay for this part of the work, and, had it not been for the taking in of so much new territory, and annexing it to our city, the outlay for extensions would have been comparatively light. But in view of the fact that such annexations have been made it became evident that a larger provision of pipeage would of necessity have to be made to meet the anticipated numerous calls upon your Honorable Body for extensions in this line of the work. So in consideration of this fact, I was instructed to make such estimates of our needs as in my judgment would be required to meet the present, and in some degree, the future needs of these annexations.

As a result of such estimate it became necessary to increase our order for pipe about 200 per cent. Though much of this has been laid in the new territory, the greater amount of the large pipe was laid within the old line of the city, from which we expect to derive a dual purpose therefrom of an abundant supply for all the newly annexed territory and all of the high

grounds south of the old line of the northerly section of our city. The pressure in this section having been greatly diminished by the increasing demands upon the previously laid mains and a lack of a more bountiful supply.

To meet the needs as above stated a 30-inch line of main was laid in Collins Street from Canfield Avenue to Griffin Avenue, and, from which, and connecting thereto, a line of 24-inch main was also laid through Griffin Avenue and the North Boulevard, from Collins Street to about 450 feet west of Sullivan Avenue, and from this line of 24-inch, a 16-inch main was laid in Woodward Avenue, from the North Boulevard to the intersection of Wilkins and Woodland Avenues, and to which all cross connections have been made where streets have been opened.

About 20 miles of distribution pipes and mains have been laid in this new territory, ranging in size from 4 to 16 inches.

The object of taking the North Boulevard for this northernly supply main, was, because this is the only direct unobstructed thoroughfare through which such a line of main could be laid. To have laid in any other street or avenue save this one, and in this district, would have caused the placing of a number of very objectionable angles and bends, and also added to the length and cost of laying the same, as well as greatly diminishing the flow by the added friction. And, it is doubtful whether we could have got through to the point we desired in any other way, from the way the streets are laid out in this section of the city. It is only necessary to give a casual glance at the city's map to be convinced of this fact. It may be well to add that special care was taken in laying the mains through this section of the Boulevard, every foot of earth filling having been thoroughly pounded in where the mains have been laid in the roadway, and to meet the needs of the resident property, branches were set on both sides of the Boulevard with pipe connections, the intention being to lay a line of pipe just outside the fence line, to avoid contact with the road beds and the lawns; this being the original plan of the early Park and Boulevard Commissioners. A line is already laid on the south side of the North Boulevard from Woodward Avenue to a few

feet west of Russell, and a number of shorter sections west of Woodward Avenue.

Considerable improvements are still being made as circumstances demand in the older portions of the city, by the replacing of some of the smaller lines of pipe with pipe of larger size, and the laying of pipe in some of the streets where pipe have not as yet been laid. The object being to meet the many changes that are constantly going on in some of these localities, calling for a greater supply of water.

The following are some of the streets and avenues in which improvements have been made in our pipeage: Miami Avenue, from Gratiot Avenue to Witherell Street, and in Witherell and Park Streets, from Miami to Washington Avenues, 16-inch mains laid; John R. and Clifford Streets, from Miami to Washington Avenues, and in Wilcox Street, from Miami to the west side of Woodward Avenues, 12-inch main laid; Washington Avenue, from Grand River Avenue to Park Street, 10-inch pipe laid; Russell Street, from Catherine to Maple Streets, 8-inch pipe laid, replacing 4-inch pipe.

RECOMMENDATIONS.

We are realizing the need of a more static head and supply of water at the intersection of Rivard, Maple and Gratiot Streets. I have thought it wise to recommend the laying of an additional line of pipe in Rivard Street, from the 24-inch main in Watson Street to Gratiot Avenue, and in Gratiot Avenue, from Rivard Street north to Rivard Street south; this line to be either 10 or 12-inch pipe. The laying of this line will greatly help the smaller pipe in this section. All through this locality, as you are aware, are numerous calls for copious supplies of water.

I find by the Secretary's records of pressure at No. 11's engine house, corner of Gratiot and Grandy Avenues, we have but a very low head, and one which fluctuates greatly at certain hours of the day. This is no doubt owing to the meager supply through the small size of some of the pipe in this sec-

tion. To remedy this I would recommend the laying of an 8-inch pipe in Calhoun Street, from Chene Street to Grandy Avenue, connecting the same with the 30-inch main in Chene Street, and the replacing of a section of 4-inch pipe in Grandy Avenue, from Pierce Street to Gratiot Avenue, with 8-inch pipe.

Watson Street, 24-inch main. When the embankments of the abandoned reservoir in line of Orleans Street are taken down, a much needed improvement can be made in the 24-inch mains in this place, leading to and from the reservoir, by dispensing with a number of very sharp angular connections that are now in these lines, thereby giving a freer outflow to the Watson Street main. I find on examination of this main that it lays diagonally with the street between Riopelle and Russell Streets, and near to Russell Street; this main is partly under the north wall of the sheds of the House of Correction, and at the intersection of Watson and Russell Streets, there is quite an offset in the main which could be remedied by taking up a section and relaying in a proper line with the street. It would be well to do this the coming season.

North Boulevard, 24-inch main. To finish out this line in accordance with our proposed plan, it will require the laying of an additional length of 2,100 feet; this will carry the line west of Grand River Avenue, and beyond the Boulevard.

As we are anticipating the work in the extension department to be light the coming season as compared with the previous two years, I would respectfully recommend that the balance of the wood pipe be taken out and replaced with iron pipe. There is now less than nine miles in use; this amount can readily be done the coming season, and will rid us of this log system.

During the early part of last season the final connection of the 36-inch main in St. Aubin Avenue was made with the lower 42-inch main in Congress Street, a section of which was cut out and a 36x42-inch branch inserted. Since connecting these mains we have a more static head, and by this arrangement of the mains we have a dual system of supply for the densely business portion of the city; two relief valves were set in connection with this work.

The new line of 30-inch main laid the past season in Collins Street was connected with the upper 42-inch main, at the junction of Collins Street and Canfield Avenue; a relief valve was set at this point.

Relief valves—During the past season several relief valves have been placed on some of our larger mains, for the purpose of counteracting as much as possible any water hammer that may be caused by a quick closing of the larger connections along these lines or from any other cause. This valve is one of my own design, simple in its action and construction of the double-seated poppet valve design. The valves proper are flat disks, and as near equal in size as practicable, thereby reducing the weight of the counter balance to a minimum. The seats have brass bushing, the valves are faced with sole leather, the body and disks are of cast-iron, the valve stem of wrought-iron.

The pipes for our extensions were furnished by the Detroit Pipe & Foundry Company; the specials by the Riverside Iron Works, of Detroit.

PIPEAGE.

The amount of distribution pipe and mains laid and relaid, and iron and wood pipe discontinued during the past season, is as follows: Total iron pipe laid and relaid $43\frac{253}{258}$ miles, of which 1,812 feet was relaid, and in addition to this 2,757 feet was laid for private use. This amount is not included in the above mileage. Wood pipe discontinued $1\frac{40}{50}$ miles, and iron pipe 4,803 feet, making the net increase of the pipeage $42\frac{11}{50}$ miles. This amount added to the measured lines of iron and wood pipe connected with the Works, will make the total length $401\frac{60}{50}$ miles, of which $393\frac{25}{50}$ miles are iron and $8\frac{25}{50}$ miles wood pipe, which in detail is as follows:

Size of Pipe in Inches.	Measured Length in Fest Por 1890.	Added Length in Fret, 1891.	DISCONTINUED LENGTH IN FRET, 1891.	TOTAL LENGTH IN FRET FOR 1891.

There are now 3,843 stop gates in use in the mains and distribution pipe, ranging in size from 3 to 42 inches, and in addition to this number we have 552 blow-off gates in size from 3 to 24 inches.

There are now conneted with the water mains 1,968 fire hydrants and 439 reservoirs; 140 hydrants and 19 reservoirs were added the past year.

It has occurred to me that some mention should be made as to what extent your honorable body are doing from year to year, specially for the Fire Department, in the way of setting branches, and laying of extra lines and larger mains. We have in the past two years laid about five miles of main, mainly for fire extinguishing purposes, and in the past eight or ten years many additional lines have been laid for this purpose alone. During the past six years not less than 1,200 branches were

set and connected with some of the larger street mains. These in the main aggregate no small amount to the cost of our construction. It may be safely estimated that not less than \$2,500 are spent yearly for this department alone. We do not mention this fact for any other reason than to show to our citizens what the Water Board is doing for this department to provide fire protection to our homes and business interests. It has been my orders, in the fifteen years I have been in the employ of your honorable body, to make suitable provision both for pipe and branches to this end. I am pleased to say, that though the amount of work done by the Water Board for the other departments of the city has been greatly in excess of that returned, it is only courteous to say that the Fire Department has rendered us very valuable service, by the use of their steamers in displacing the water in the mains when making our large connections, and also at such times when serious breaks have occurred in the same.

TABLE OF SERVICE CONNECTIONS.

With iron and wood pipe, of sizes from § inch to 6 inches, in detail, as follows:

REPAIRS DEPARTMENT.

This department of the work has received prompt attention in the many items coming under its care. Three thousand four hundred and ninety taps were made with the distribution pipes, of sizes from § to 4 inches.

The break which occurred in the 30-inch main in Congress street, between Second and Third streets, was promptly repaired. It was very fortunate that it occurred during the middle of the day, enabling the repair department to give it prompt action in closing the main gates. The broken pipe was taken out and a new length put in, the water being let on again the day following. In carefully examining the pieces as they were taken out, I could find no defects which could have caused the break, the metal was very homogeneous in quality and thickness, it is quite possible the joint may have been overcalked, as the break was from the hub end.

Pumping Works—The No. 1 inlet pipe was taken up the past year, and a new trench dredged out to receive it; the lay of the pipe previous to this was in a diagonal line crossing the grounds, and in dredging out a trench for the No. 4 inlet pipe, a portion of the pipe slid into said trench, rupturing two of its joints. This line of pipe has, as I have already stated, been taken up, and it has been relaid again in a line parallel with the grounds, and will have when completed an additional length of 500 feet, making a total length from the shore line of 1,505 feet; five of the lengths and two strainer boxes and one relief valve box are yet to be laid. Owing to unforeseen delays, and the cold weather being upon us we were unable to complete the laying of the same. The balance of the pieces will receive early attention the coming season.

In connection with the above mentioned work, a line of brick conduit and gate and strainer well was built. This conduit and well were built to take the place of the old gate and crib house, and a section of the iron inlet pipe running through the river bank. The conduit has an inner diameter of 5 feet. The well is 22 feet deep, with a diameter of 18 feet; the top is

arched over with brick, sprung from a number of I beams, two man-hole frames are built in the same. The well is fitted with strainer plates, two pipe thimbles of cast-iron are built in wall of the well and conduit, two box sluice gates are bolted to the thimbles, each having an opening of 5 feet diameter. The entire brick work was done by men in our employ, and has been executed in the most satisfactory manner.

The contract for dredging, taking up and relaying the inlet pipe, was awarded to Capt. Thomas Davis, of Detroit. The extra lengths of the iron inlet pipe to Stephen Pratt, of Detroit, and the box sluice gates, with the adjuncts, to the Russel Wheel & Foundry Company, of Detroit.

Considerable labor has been done on the south end of the grounds adjoining the river, in connection with the above work. The excavations of the conduit and well were hauled to the dock, and deposited along the line of the same.

Considerable grading was done at the south bank, and the surplus earth taken to the dock.

I am pleased to know that your Honorable Body have decided to have the dividing dock rebuilt the coming season. This is a very much needed improvement, the dock having been in a very unsafe and unsightly condition for some time.

When doing this work it will be well to lower the dock 18 inches to 2 feet, as the dock has always been too high, and at the present stage of the river it is doubly so. It will require some changes in the previously made plans, as we wish to simplify the work and reduce the cost to a minimum, until it becomes necessary to build of stone.

Surface Inlet—It is thought advisable to extend the same to a point in line of the south end of the dock; this will require the laying of about 700 feet of iron inlet pipe. It would be well to do this work the coming season.

The work of making a branch connection between the said surface inlet to the gate well of the No. 4 inlet may be delayed until it becomes necessary to do something with the settling basin.

It will be seen from the tenor of my last year's report that

some extensive repairs would be needed upon the settling basin and dock during the season just closed. And, as neither of these have received the projected repairs, I have thought it proper to give some explanation why this work was not prosecuted.

It has been a matter of no little concern, as from year to year the question has arisen, what ought to be done to the settling basin; fifteen years of continuous use having given rise to the conjecture that with this length of time it must be in anything but a pleasing condition. The intention having been that when it became necessary to make any extensive repairs upon it, the most substantial thing to do would be the paving of the inner surface and the building of the dividing wall or dock with stone and concrete. As a work of this kind could not be done without a very large outlay, it was deemed prudent to pump out the settling basin and ascertain to what extent a work of this kind would require, and what the probable cost would be to carry out such project. So during the close of the month of October, and the early part of November, the basin was pumped out, exposing its entire inner surface to view for inspection, and on November 5th your entire body accompanied by some of your officers, had the pleasure for the first time of seeing the inside of the basin, and as a result of which the many conjectures as to unsightly objects were not to be found, but to our astonished gaze we found what looked to us a most fertile valley, a short growth of sea grasses covering almost every available spot that was not otherwise covered with gravel. So in view of the cleanly appearance of the basin it was thought unwise to spend the amount necessary to prosecute this work, as proposed, at least for several years to come.

It has been suggested to me, by the Secretary, that a description of the settling basin, with its adjuncts, and a general lay of the grounds at the pumping works, would be of interest to the many readers of our yearly reports. In compliance with this request, I shall endeavor to be as concise as possible, and confine myself to the branch of the work immediately under my care.

Since the starting up of the work in the fall of 1877, many changes have been made in the general arrangements of the works and grounds, prominent in which is the extension of the buildings for a third engine, the building of an additional coal shed, the taking down of No. 1 and rebuilding on a larger scale, the laying of an additional 42-inch main through the grounds, and the connecting of the Nos. 1, 2 and 3 engines thereto.

Prior to the building of the settling basin, the water in the river extended some distance beyond the north end of this basin. The greater part of this ground through which it is located was of a swaly or marshy nature. In the construction of this basin, it was necessary to build, on three sides of it, walls of piles and sheet piling, to sustain the walls of puddled clay, two rows of piles and sheet piling being driven for that purpose. The north and east walls have four rows of piles and puddle walls of clay eleven feet thick. The west wall or east dock has also four rows of piles and two rows of sheet piling, with wall of puddle clay fourteen feet thick. This dock has a width of twenty-five feet, and is the dividing wall between the canal and settling basin. The south wall of the basin is the natural river bank, having a width at the ground line of The basin, as it now is, has a width of 350 feet, and an average length of 826 feet at the high-water line, and a depth varying from twelve to sixteen feet; its total capacity when at the high-water line, is about thirty-one million U.S. gallons.

This basin when built had but one influent and effluent pipe and conduit, and two gate and crib houses, the lower part of which were submerged in the basin. Since this, two additional influent and one effluent pipe and conduits have been added, having a direct connection to and from the basin; and, in addition to these, an independent line of conduit and influent pipe has also been added. This has a joint purpose of influent and effluent, and can be used with or without the settling basin. This is our side pass, running along the east side of the basin,

the purport of which is, to take the place of said basin, when for any cause, it may need pumping out. There are two branch connections from this side pass, one near the south end and the other north of the basin.

This side pass has an inner diameter of six feet, and a total length of pipe and conduit of 2,656 feet, gate and strainer wells intersect this line.

One of the influent conduits connecting direct to the basin, is built near the surface of the river and grounds; this is designated surface inlet, and is only used as occasion may require, when anchor ice is causing trouble by clogging the strainer at the intake of the influent pipe, and is an efficient auxiliary to our influent pipe.

Two of the influent pipes extend from the shore line out in the river 1,505 feet, and one 1,030 feet, and are submerged at their intake in twenty-five feet of water. Their diameters are five and six feet, and in twenty-five foot lengths. The pipes are made of boiler-plate, with flexible joints; lugs of wrought iron are rivetted on either side through the axes of the pipe, and held together with large joint-bolts. The flexible joints allowing the pipe to conform to the bed of the river, piles are driven at each joint and around the strainer boxes, and through the trench in the deep cutting two piles were driven at each joint, one on either side, and a saddle of 6×12 inch oak timber bolted to the piles, to prevent the pipe from raising, either from the back filling or the washings from the river, experience having taught us this precaution.

The effluent gate and crib-house at the north end of the basin, have been abandoned as such, and two brick gates and strainer wells were built to take its place, and were built one on either side of said conduit, about 50 feet apart centres; four branch connections were built from the wells, connecting with this conduit, and at the intersection of these branches with the main line, two well-holes were built, connecting the branches and the main together, the flow of the water passing through the branches to and from the wells, and are so

arranged with shut-off gates, that the wells may be used together or separately. The wells have an inner diameter of eighteen feet and a depth of twenty-one feet, with five-foot openings.

Since building the settling basin, the piles and sheet-piling have been cut down to about 6 feet below high water line, and the admixture of earth and clay filling above this point to the ground level, graded off to a gradual slope of about 31 to 1. The surplus earth was deposited inside the basin in front of the sheet piling, making a back support to the same. All the grounds east and north of the basin having been thoroughly filled in, and having had some 10 years to settle, has added solidity to the embankments. The sloping banks of the basin were sodded above high water line, and below this point covered with stone chips and fine gravel. The improvement to the appearance of the basin was very marked by this change, the piles and sheet piling had become very much disfigured with age and decay, and were very unsightly. While doing this work the water in the basin was lowered some 6 feet by partly closing the influent gates. The west wall or dividing dock between the basin and canal stands the same as when first built. This dock extends about 750 feet beyond the south end of the basin, and 300 feet north of the same, making a total length of 1,900 feet. Just west of this dock is a canal 45 feet wide between the walls of piles and sheet piling, and 17 feet deep. Coal and other supplies are brought to the works through this canal. The west side of said canal has been cut down in a similar manner as the walls inside the basin, and the earth graded off, the sloping bank sodded and graveled.

The entire grounds to the end of the dock covers an area of 60 acres, with a width of 967 feet, and a length of 2,700 feet, and a frontage on Jefferson Avenue conforming to the angle of the avenue of 1,016 feet.

In closing this report it is only courteous to say that the help in the office of my department has been very efficient and the co-operation with the other departments very harmonious. Transmitted with this report are the locations of the pipes, mains and gates, also inventory of pipe, special castings, and tools on hand to January 2, 1892.

I also submit a sketch of the Pumping Works grounds, and its adjuncts, showing the general lay of the settling basin, with its influents and effluents, and the main pipeage. (For particular in detail see sketch.)

REPORT

OF THE

BOARD OF WATER COMMISSIONERS

OF THE

CITY OF DETROIT.

WATER COMMISSIONERS' OFFICE.

DETROIT, January -, 1893.

To the Common Council of the City of Detroit:

The Board of Water Commissioners respectfully submits its annual report for the year ending December 31, 1892.

Accompanying this report to your honorable body, are the reports of the Secretary, upon the general management and financial transactions of the Board, and of the several heads of departments, to which your careful attention is respectfully invited.

Our fellow-citizens will be pleased to learn that the long and vexatious litigations growing out of the Hurlbut will, have at last come to a conclusion. The Board will soon be in the position to improve considerably the Water Works park, as it will be remembered that the income from this entire legacy is to be used to beautify the said grounds and for no other purpose.

On the first day of August next, water bonds to the amount of \$146,000 will become due and payable. There will be in the sinking fund at that time something over \$75,000. It will be necessary, therefore, to make up the difference of \$71,000, either from the general fund or by the issuance of new bonds. The Secretary has estimated that at that time there will be in

the general fund, at least \$75,000, which we believe to be correct, and it is the unanimous opinion of the members of this Board that the interests of the city affected, would be best conserved by the payment of this balance from this fund.

The building of an additional engine and the necessary construction for its operation have already commenced, and will be completed by the first of July. It will be seen by the Engineer's report, that it was not increased consumption that required this construction, as the quantity pumped in 1892 was considerably less than that of 1887, five years ago.

The unusual and unexpected demand for water during the protracted heat and drouth of July and August practically exhausted the pumping capacity of the Works, and forced this step upon the attention of the Board. The possibility of its recurrence made it necessary to provide for such a contingency, and for this reason only is the new engine being purchased.

We feel that we have reason to congratulate ourselves upon the condition of the Works at this time, and upon the changes or innovations introduced in its operation. The establishment of an oil plant by which there is an annual saving of over \$12,000 in the cost of fuel could not have happened more opportunely, as the condition of the natural gas supply would have forced us months ago to resort again to the use of coal, which at the present prices would have made our expense for pumping water over \$18,000 more than it now costs with oil.

The thorough efficiency of the Works, and an economical administration of its affairs, we have aimed to accomplish. And when we consider that the operating expenses of 1892 were \$2,000 less than those of 1888, notwithstanding that the population has increased 50,000, with all the accompanying mechanical and industrial pursuits that have been established during this time, we certainly feel a just pride in the results which the introduction of remedial measures have produced.

The efficiency of the Works has also been improved in various particulars, especially that of equalizing the head of water throughout the city to such an extent as to cause complaints of a short or insufficient supply to almost entirely cease.

We are also gratified to state that under arrangements entered into with the Board of Public Works at the beginning of the year, harmony has prevailed in our relationship with that Board, and we desire to add further that, with all the other departments of our municipal government, the conduct of mutual affairs has been most pleasant and influenced simply to the accomplishment of the public good.

All of which is respectfully submitted.

SAMUEL G. CASKEY, AUGUST GOEBEL, HENRY M. DUFFIELD, J. L. HUDSON, FRANK E. KIRBY,

Commissioners.

REPORT OF THE SECRETARY.

DETROIT, January 2d, 1893.

To the Board of Water Commissioners:

GENTLEMEN,—I have the honor to present herewith my report of the general transactions and operations of the Works for the past year, together with a detailed statement of the financial affairs of the Board.

Probably the most important operation of the Board has been, for the last four years, and is to-day, its determined efforts to

REDUCE THE WASTE OF WATER.

It is an established fact the world over, that the consumption of water increases much more rapidly than the population, where no means are in use to keep a record individually of such consumption.

Various reasons, other than the true one, are often given for this increased consumption. A certain portion of this increase is often ascribed to the growth of the manufacturing and business interests of a community; but when it is considered that if a certain business interest will provide support for ten families and that the establishment of a similar interest will provide for ten additional families, it seems to be a fact that the prorata of families in their relationship to business must necessarily remain the same, and that some other cause must be sought for.

In establishing and illustrating certain facts, I am obliged to have recourse to tabular statements, and although figures must necessarily be dry and uninteresting, yet I earnestly invite careful attention to the tables herewith introduced.

To illustrate the rapid growth in the consumption of water from year to year, I have prepared the following table, showing

the number of families supplied, the total quantity of water pumped, and the *pro rata* quantity for each family in each year during the entire time that the Works have been under a Commission and a record kept:

	FAMILIES	WATER PUM	PED.	
YEARS.	SUPPLIED.	TOTAL QUANTITY.	PER FAMILY.	REMARKS.
1852		235,840,275		
1853	4,288	308,531,743	70.868	
1854	4,619	876,265,126	81,460

1874	18,853	3,289,872,635	174,511	l
1875	19,606	4,207,454,260	214,600	
1876	20,102	4,065,134,470	202,225	
1877	20,345	4,218,239,790	207,090	Į.
1878	20,603	4,845,743,830	210,927	
1879	21,341	5,129,599,110	240,348	
1880	22,465	5,552,965,310	247,183	Average per cent
1881	28,749	6,543,127,968	279,722	of increase fron
1882	25,442	6,284,000,742	248,062	1879 to 1888, in
1883	27,415	7,379,327,788	269,170	clusive, 8.5.
1884	29,424	8,510,614,140	289,260	
1885	3 0,533	9,970.829,580	326,886	
1886	31,946	10,576,571,254	331,070	
1387.	34,486	13,168 859,808	381,860	†
1888	36,863	14,880,166,670	890,098	
1889	39, 15 8	12,875,334,453	32 8,880	Commenced Metering
1890	41.467	12,120,944,532	292,300	Average per cent
1891	43.983	12,057,261,236	274,470	of decrease since
1892 ;	46,400	12,276,612,482	264,582	1888, 11‡.

A glance at the right hand column will give the fact that the pro rata quantity for each family supplied, increased from 70,000 gallons in 1853 to 390,000 in 1888, an average annual increase of 12.86 per cent., and an average increase during the ten years previous to 1888 of 8.5 per cent.

In consideration of the fact that in London, Eng., where waste is reduced to a minimum but about 55,000 gallons is the pro rata per family per annum, and in Providence, where meters are almost in general use, the pro rata is less than 75,000, I cannot but believe that this column of figures, with its broad base of 390,000 gallons in 1888, is but a monument to the evergrowing habit of wastefulness in man, and that the figures thereafter, with those of 1888 as a base, form another column which is fast becoming a monument to the efficiency of the meter system.

COST OF PUMPING WATER.

For the purpose of proving that the average cost of pumping one million gallons of water has been, with the use of coal, \$4.45, I have prepared a table giving the exact expenses each year for the past ten years:

YEARS.	No. of Gallons Pumped.	Total Annual Expense.	COST PER MILLION.	REMARKS.
1888	7,879,827,188	\$30,678 72	\$4 15	
1884	8,510,614,140	32,172 81	3 78	I
1885	9,970,829,580	35,581 58	3 56	
1886	10,576,571,254	36,628 19	8 46	(
1887	18,168,859,808	57,852 94	4 85	Pressure increased.
1888	14,380,166,670	60,284 11	4 19	
1889	12,875,834,453	61,560 48	4 82] }
1890	12,120,944,539	54,448 49	4 49	1
1891	12,057,261,236	58,012 77	4 89	Rate reduced by use
1892	12,276,612,482	53,287 89	4 27	of oil Nov.and Dec.

Previous to 1887 the average cost was less, but that year and since, with certain variations due almost entirely to the character of the coal purchased, the average cost previous to 1892 has been \$4.45. This increase is due to the fact that in 1887 the

Reservoir was abandoned and the pressure materially increased throughout the city.

INTRODUCTION OF METERS.

In the spring of 1889, the placing of meters was commenced and has been steadily and systematically continued until, at the close of the year, all, practically, of the manufacturing and business interests of the city are so supplied. The causes that led to this step and some of the results therefrom have been fully discussed in my previous reports.

I desire, however, to reprint a table that appears in my report of 1890. To me it is a convincing argument of itself, for the use of meters, and fully illustrates the injustice of selling water to consumers under the system of assessments made by estimating, or rather guessing what the quantity is that is being consumed.

A, B, C, etc., represents certain consumers in the city.

The second column shows the quantity of water that each one was found to be consuming by attaching meters to their service pipes.

The third column shows the amount each paid monthly previous to being metered.

The fourth column shows the rate per 1000 gallons that each one paid under the assessment plan.

CONSUMERS.	Monthly Consumption as per Meter.	MONTHLY Assessment.	Paid for 1,000 Gallons.
A	583,500 gals.	\$7 50	1‡ cents.
В	132,000 "	2 00	1 1 "
c	3,429,803 ''	36 66	1 "
D	531,875 "	33 33	6 <u>1</u> "
E	185,250 ''	13 67	7
P	2,697,831 ''	119 16	4 * ''
3	472,201 ''	39 66	8‡ "
H	259,812 ''	17 50	64 ''
I	188,850 ''	28 83	20 "
K	727,125 ''	50 00	67 "
L	2,127,050 ''	53 33	21 ''
K	270,750 "	37 66	14 "
N	1,352,850 "	142 00	104 "
σ	462,818 "	43 00	91 ''

It will be seen by the above statement that but one of these consumers paid 20 cents per 1,000 gallons, which is the rate charged when the quantity is estimated, while one paid only one cent per 1,000 gallons, or one-twentieth of the amount charged the former.

It is a well known principle of good government that the most careful espionage should be maintained upon the weights and measures that are in use for the purpose of measuring the quantities of articles that are for sale; and yet, in every community where the assessment plan is in operation, the people collectively are selling water to themselves individually by means of a measure that is more like an elastic bag than anything else, that expands for some and shrinks for others.

FINANCIAL SAVING EFFECTED.

To properly estimate the *financial* saving effected by the restrictive measures adopted by the Board, it will be necessary to make an estimate of the quantity of water that would have been pumped each year had the circumstances remained the same. By an examination of the first table it will be seen that the average increase in the *pro rata* for each family during forty years has been $12\frac{86}{100}$ per cent. and that this per cent. for the past ten years has been $8\frac{6}{10}$.

Using this latter per cent. of increase we have the following table.

	Families	WATER PUMPED-	estinated.
YEARS.	Supplied.	TOTAL QUANTITY.	PER FAMILY
1889	39,158	16,578,858,448	483,256
1890	41,467	19,042,973,344	459,383
F891	48,933	21,890,320,178	498,266
1892	46,400	25,084,675,200	540,618

The total quantity of water, according to this estimate, that would have been pumped during the four years, is 82,591,827,-170, and the quantity that was actually pumped was 49,330,152,-703, showing a saving of 33,261,674,467. By reference to the

second table it will be seen that the cost of pumping one million gallons of water, for five years previous to 1892 has been at the rate of \$4.45 per million. Multiplying the number of gallons of water saved by the cost of pumping, shows a saving of \$148,014.45 in the expense of pumping water alone.

The extension of the Works which seemed imperative upon the Board in the spring of 1889, and which your honorable body estimated would cost at least \$600,000, has been saved also, at least up to the present time. The interest upon this amount would have been \$24,000 per annum, and for four years \$96,000.

The meters including superintendency and every other expense incident to their introduction have cost the Board during the four years \$80,224.47.

The Superintendent of the meter department reports that the present valuation of these meters in service and in stock, including tools, etc., is \$71,618.37.

In conclusion then we have the following:

Meters.	Dr.	Cr.
To Expense	. \$80,224.47	
By present values		\$ 71,618.87
By pumping expenses saved		148,014.45
By interest saved		96,000.00
	\$80,224.47	\$315,632.82
Balance in favor of the meters		\$335,408.85

REDUCTION IN WATER RATES.

One year ago, in your report to the Common Council, these words were used, "The cost of running the water department of any city, depends largely upon the quantity of water which the Works are called upon to supply. If the supply can be reduced so can the cost. If the cost can be reduced so can the rates for water; and that precisely is what your Commissioners are doing to-day."

I think I have already proved conclusively all except the last proposition, and now let us see about that

I am again obliged to have recourse to a tabular statement which shows first the years, second the total number of families supplied, third the total rates received, and fourth the pro rata amount for each family.

	AMILY.	PER FA	TES.	WATER RA	Families.	YEARS.
	22	\$10	74	\$205,624	20,102	1876
	88	10	12	210,288	20,845	1877
	10	10	95	208,198	20,608	1878
	22	10	13	218,110	21,841	1879
	19	10	78	227,452	22,465	1890
	18	10	82	241,884	28,749	1881
	28	10	79	261,725	25,442	1882
Would HAVE RE	21	10	06	280,049	27,415	1888
CRIVED AT AV-	21	10	24	800,467	29,422	1884
	25	10	10	818,205	80,588	1885
\$326,168 66	85	9	81	814,952	81,946	1886
352,102 06	86	9	59	322,834	84,486	1887
876,871 28	84	9	26	844,815	86,868	1888
899,808 18	39	9	27	867,925	89,158	1889
428,878 07	85	9	78	387,877	41,467	1890
448,555 98	85	8	97	889,079	48,938	1891
478,744 00	67	8	98	402,584	46,400	1892

There was a reduction in the rates in 1886. I have taken ten years previous to that, simply to establish this fact, that when the schedule of rates is unchanged, notwithstanding the fact that the rates received are from all purposes, business as well as families, the pro rata per family remains practically the same.

In 1876 the pro rata was \$10.22, and in 1885, ten years after, the pro rata was \$10.25. The average pro rata for these ten years was \$10.21, by which I can multiply the number of families supplied each year and ascertain almost the exact amount that would have been received, had the same rates been in force.

In the year 1886 the Board reduced the rate for household purposes for a family to \$5.00 per annum. This went into effect July 1, and affected the receipts of that year for six months only. In 1887, 1888, 1889 and 1890 the average pro-

rata was reduced to \$9.36, which caused a reduction in our receipts of over \$30,000 per annum.

In 1891 the hose tax was abated, the reduction being about \$20,000 per annum, affecting the receipts of one-half of 1891, but all of 1892. At this time the meter rates were also reduced from ten cents per 1,000 gallons, first to six and two-third cents, then to five cents, and finally to three and one-third cents where it now stands.

The pro rata of 1891 was reduced to \$8.85 and that of 1892 to \$8.67, making the receipts of the latter year, affected by all these reductions, \$71,209.02 less than they would have been under the schedule of six years ago, and this reduction is due as follows:

To	reduction	in	rates for family use	\$30	,000	00
*	**	• •	hose tax	. 20	,000	00
"	**	"	meter rates	. 21	,209	02

This amount, \$71,209.02, the Board are saving each year directly to the water rate payers, and are still enabled to meet all outstanding obligations, the expense of operating the Works and also of all construction and extension, which, on account of the rapid growth of our city and increased limits, has necessarily been very large.

METER RATES.

As shown by last year's report, there is no city in the world that supplies water as cheaply to the ordinary consumer as Detroit, 300 gallons of water for one cent! Considerable has been said at various times as to whether the placing of meters did not discriminate against those who were thus supplied. Let us see. Last year we supplied to the entire consumption that was metered 1,589,885,250 gallons, for which we received \$61,585.62, or .088 cents for each 1,000 gallons.

During the same time we supplied all the consumption that was not metered 10,686,727,232 gallons, for which we received \$340,949.36, or for each 1,000 gallons, .034 cents.

It must be remembered, however, that the unmetered consumption includes all water for the Fire Department, and all water for parks, fountains, etc. Could this amount be eliminated from the gross amount, I have no doubt but that the rate for 1,000 gallons under either manner of distribution would be the same, or nearly so.

OIL PLANT.

During the year 1891 the attention of the Board was attracted to the use of crude oil as a fuel, and information and results of experiences were sought for far and wide. The Board finally became perfectly satisfied that with proper combustion, 168 gallons of oil equaled in duty one ton of coal, and as oil could probably be contracted for at about one and one-half cents per gallon, and as coal had cost the Board in the coal houses on an average of \$4.25 per ton, it was safely estimated that there would be, under proper conditions, a saving of \$1.73 per ton of coal, or upon the basis of the consumption of 1890 (7616.50 tons), a saving annually of \$13,176.54.

On the 20th day of April, 1892, a contract was entered into with the National Supply Co., of Chicago, for an Oil Plant complete, including a pipe line of 10,000 feet to R. R. track in the sum of \$12,500.

The Plant consists of two tanks, each with a capacity of 1,873 barrels, inclosed in a brick house neat and tastefully constructed with corrugated iron roof, a suction pipe to boilers with two Snow Duplex Pumps in boiler house connected in batteries to be used alternately, and two oil burners under each of four boilers with the necessary steam and oil connections thereto.

The Pipe Line is of 3-inch wrought iron pipe and runs from Tank House through grounds to Jefferson avenue, west on Jefferson to Baldwin, north on Baldwin to Champlain, west on Champlain to Bellevue, thence north to Kercheval, and west again to Belt Line R. R. track. The line pump station house is built on the west side of this track and on a line with Kercheval street, is of brick and contains two Duplex Snow Pumps with 8-inch steam cylinder, 4-inch oil cylinder and 10-

ORE OR

inch stroke, and a 20-horse vertical boiler trimmed. The entire length of the pipe line is 12,412 feet.

The pumping station is 29 feet above the tank house and the number of gallons that can be discharged through the pipe by gravity alone is $33\frac{1}{8}$ gallons per minute.

The pipe line will hold 113 barrels of oil, but which can be pumped out by means of an extra suction pipe connected with the pumps in the boiler house.

The boilers at the Works are Marine boilers and the same that were placed there about 16 years ago, and though by no means the best adapted for the burning of oil, or coal for that matter, yet the results so far have been fully up to the expectation of the Board.

During the months of August, September and October, a portion, about two-fifths, of the fuel consumed was of coal, as the Board desired to relieve the pressure against the walls in the coal house, which gave evidence of giving way, and which it became necessary to repair immediately.

In November, oil was used exclusively and showed a saving of over \$1,000 as compared with the coal then in use.

In December the saving effected amounted to \$1,112. This saving is estimated on the old price of coal, \$4.25 in the coal house. If the present price of coal betaken into consideration, and I think it should as the price of oil undoubtedly is affected thereby, this saving is practically over \$600 more a month. The average monthly consumption of coal in 1890 was 634 tons, which at the present market price would have cost the Board at least \$5.25 per ton. Another saving by the use of oil is that of labor, which I have not spoken of before. Our force at the pumping works is reduced as follows:

out breman, salary per month
Three coal passers, each \$45 00
Total saving each month
or \$2.280 each year.

One fireman salary nor month

THE NEW ENGINE.

During the months of July and August there was such a prolonged season of heat and drought as to be almost, if not quite, an epidemic.

At certain times during the day, so great was the consumption of water at this time that all three of the engines were required to satisfy the demand, pumping some hours at the rate of three million gallons per hour. This was the first time in the history of the Works that it became necessary to run the three engines at the same time, which was not due in the least to the increased uses or increased consumption owing to the growth of the city, inasmuch as the total amount pumped during the year was much less than in 1887.

It was nothing more nor less than an epidemic, and an epidemic that was possible to occur again, and for that reason the Board of Water Commissioners deemed it its imperative duty to prepare for its recurrence.

It is an absolute necessity that there should be at all times one engine in reserve, as accidents and breakages are liable to occur, in fact are sure to occur, as our experience teaches us. Had the slightest occurred at the time above referred to, a great many consumers would have been deprived of water, especially in the northerly portions of the city.

For these reasons it was determined by the Board to purchase another engine, notwithstanding the fact that the annual consumption is steadily but surely decreasing. It was the strongly expressed wish of the Board, in referring this matter to Commissioner Kirby for investigation, to procure an engine of the very latest improved pattern, and one that would perform the work required at the very least expense.

Commissioner Kirby visited various cities and examined their pumping engines, and Chief Engineer Edwards and First Assistant Engineer Gould also visited Chicago and examined engines in operation there, and all were impressed with a preference for the Vertical Triple Expansion Engine manufactured by the Edward P. Allis Company. Proposals were solicited

from that company and also from Henry Worthington to furnish a Triple Expansion Engine, with foundation and boilers complete for operation. The Edward P. Allis Company's proposal was for a vertical engine for \$90,000, and that of Henry Worthington for a horizontal engine for \$87,000. The proposal of the former was considered the smallest of the two and was accepted by the Board.

The description of this engine is as follows:

It is guaranteed to deliver 24,000,000 gallons in 24 hours against a head of from 116 feet to 135 feet, and to develop a duty of 130,000,000 foot pounds for each 100 pounds of coal (best anthracite), in a 24-hours' test, and to develop a duty of 120,000,000 foot pounds for each 100 pounds of coal in a continuous test of 30 days, and to be supplied with steam at a pressure of 125 pounds per square inch. The steam cylinders will be 3 in number, one high pressure cylinder 28 inches in diameter, one intermediate cylinder 48 inches in diameter, and one low pressure cylinder 74 inches in diameter, all having a stroke of 60 inches.

There is to be 4 horizontal tubular boilers 62 inches in diameter by 20 feet long, each boiler to contain 49 4-inch tubes.

Contracts were also entered into for the extension of the engine house on the west end to correspond with the previous extension on the east end in the sum of \$22,000, which also includes the extension of the boiler house. This work has already commenced and is well under way. The entire cost of all construction, necessary to the operation of the engine, will be \$140,000.

DOCK.

It became a matter of necessity to do something in the way of repairing or rebuilding the dock, as it had reached such a dilapidated condition as to be not only an unsightly object but dangerous even to walk over. This dock forms the dividing wall between the canal and the settling basin and extends into the river about 800 feet beyond the south line of the basin, being in all 1,900 feet long.

It was determined by the Board to simply rebuild that portion extending out beyond the basin, and to leave the balance untouched until next season, when, unless some good reason should arise opposed to such action, to remove entirely that portion between the basin and canal, thus making the former larger to that extent.

Since the Board discontinued the purchase of coal as a fuel the canal and dock have ceased to be useful, and are certainly far from being ornamental, and it is the present opinion of the Board to do away with what will continue to be, as long as it exists, a source of endless expense.

INLET PIPES

The contract with Capt. Thos. Davis, of the season of 1891, to take up and relay what is known as inlet pipe No. 1, and to extend the same into the river 500 feet farther, was not completed until about August 1st, 1892.

The diver employed to inspect the condition of this pipe, as well as that of the other two inlet pipes, reported that in one instance he found an opening between the ends of the pipes large enough to admit the insertion of a hand, and that in a great many other instances the joints were by no means water tight, in fact that such a condition was almost an impossibility with the most careful attention unless packing was used. The Committee on Pumping Works were instructed by the Board to put these pipes in perfect condition, and the result was that under instructions from the committee, a contract was entered into in the sum of \$900 with H. F. Dwyer to caulk every joint thoroughly with packing in all the three inlet pipes.

This was accomplished thoroughly and to the satisfaction of the committee.

Inlet pipe No. 2, running alongside the dock and which is 500 feet shorter than the other two, was found in a bad condition. From near the shore to within about 100 feet from the end of the dock, the pipe has gradually worked upwards until about 200 feet of it is not more than two feet beneath the

water. This portion of the line, it was discovered, had been packed at the joints with cement, sewed up in bags, and which were placed in the bell end and hardened there. This cement had in the hardening process somewhat contracted, and at a number of places had broken and crumbled away. This inlet pipe from the strainer to about 100 feet north of outer end of dock was found in a good condition and was carefully packed by Mr. Dwyer.

It was, however, determined by the committee to do nothing further with this pipe, and to abandon the use thereof until some time in the future, when, if it was thought best, that portion nearest the shore could be taken up and relaid, and the whole be extended 500 feet farther into the river to correspond with the other two pipes.

FIRST PUMPING POWER.

Through the courtesy of Henry Plass and his sister, Mrs. Wm. H. Hopson, the Board are now in possession of the first pumping power used in the city of Detroit to supply its citizens with water.

In the year 1825 Bethuel Farrand, father of Jacob S. Farrand, and Rufus Wells, commenced the construction of Water Works under an act of the Common Council entitled "An act granting to Bethuel Farrand and his legal representatives the sole and exclusive right of watering the City of Detroit, and for other purposes."

Soon after Mr. Farrand transferred his interests to Mr. Wells, and in 1827 the Works were pronounced complete and the water introduced.

The pump house was erected at the foot of Randolph street. It was a frame building 20 feet square and had a cupola 40 feet high. The water was raised by two pumps of 5 inches bore, driven by horse power into a 40-gallon cask at the top of the cupola. From thence the water was led through tamarac logs of 4½ inches interior diameter to the reservoir which was situated where the Water Office now is.

The reservoir was 16 feet square and 6 feet deep, and was

constructed of two-inch white oak planks caulked with oakum and placed on a timber frame 16 feet high and covered with a shingle roof. Water was distributed from this reservoir through a line of logs 34 inches bore.

The horse power referred to is the one now in possession of the Board.

Mr. Henry Plass has furnished the Board with its history since its abandonment by the city in the year 1830. It was superseded by a 10-horse-power engine driving a rotary pump and forcing the water through a 3-inch iron pipe, a piece of which pipe is on exhibition at the Pumping Works today. The horse power was sold to Mr. Fairbanks who four years after sold it to Gabriel Chene by whom it was used in grinding apples. In 1858 the late Henry Plass purchased it of Mr. Chene and used it for some time in his cider mill located on Atwater street. In 1866 he removed it to his farm in Grosse Pointe. It was here continued in its old service of grinding apples until 1878 when, in the words of Mr. Plass, "it stopped short never to go again."

This horse power has been removed to the Pumping Works and it is the intention of the Board to have it set up in some convenient place and preserved as an object of interest and curiosity.

CHIEF ENGINEER JOHN E. EDWARDS.

In the year 1860, thirty-two years ago, John E. Edwards was appointed Chief Engineer of the Works, and during all the intervening years has been a valuable and faithful official. The three large engines at the Pumping Works, which have been and still are objects of wonder and admiration, were designed by him, and, at the time of their construction, excelled in economical operation anything of their kind in the country, and even to-day, notwithstanding the progress made in this branch of engineering, are surpassed by few.

It had become apparent to the Board, however, during the year that is past, that Mr. Edwards, now in the 72nd year of his life, should be relieved from the active duties of his posi-

tion, and in order that it might still retain the benefit of his knowledge and experience, appointed him Consulting Chief Engineer. A memorial prepared under the instructions of the Board and signed by the members thereof, was presented him which fitly expresses the prevailing sentiments of his employers, his associates and those who are acquainted with him.

PURITY OF THE WATER.

From time to time, there emanates from some source a doubt, and sometimes a direct denial, of the purity of the water supplied the city. We did not escape this the past year; in fact considerable agitation prevailed in the public mind, inasmuch as the origin of the assertion of its impurity was of such authority as to almost demand credibility.

It happened however very fortunately for the Works and the people that at this time Dr. J. E. Clark, a recognized authority in chemical analysis, was just completing a paper to be read before the Detroit Chemical Society, in which the purity of Detroit River water was treated exhaustively.

He closes his paper with these words: "The result of my analysis demonstrates clearly that the water supply of our city is unexcelled, for purity, by that supplied to any other large city in the Union."

His paper together with an analysis made by the Health Officer, Dr. Samuel P. Duffield, will be found at the close of this volume.

I presume now that we can rest in peace, for a few years at least, as far as the unquestionable purity of the water is concerned.

COMPARATIVE STATEMENT.

The following table showing conditions of the past five years is very interesting. There is hardly a line that does not speak volumes to any one interested in the growth of our city and an economical administration of its affairs.

The most important fact however, as far as the Water

Works and its management is concerned, is forcibly illustrated in the two lines "Estimated population" and "Operating expenses."

From 1888 to 1892 the population has increased 46,000 with all its attendant factories and business interests and the expense for operating the Works instead of increasing in the same proportion has actually decreased \$2,251.00.

COMPARATIVE STATEMENT.

	1888.	1689.	1890.	1891.	1892.
Daily average consumption in gallons	89,897,716	35,274,888	38,208,067	38,083,592	88,634,554

To the Honorable Board of Water Commissioners of the City of Detroit:

GENTLEMEN:—Under instructions from the Committee on Ways and Means, we have carefully examined the books and vouchers of the Water Works from January 1st to December 31st, 1892, and find them correct.

WATER WORKS BONDS.

The following table shows the whole history of the bonded indebtedness of the Board, in which will be seen that the total amount of bonds issued is \$1,850,000, of which \$621,000 have already been redeemed, leaving our standing \$1,229,000, upon which there is an annual interest of \$76,540.

One hundred and forty-six thousand dollars of these bonds fall due the first of next August, which will be redeemed by the Board without new issuance. This will leave \$1,083,000, at an annual interest of \$66,320.

ASSESSMENT REPORT.

The following table is a statement of the assessment made in May and June and going into effect July 1, 1892. The whole number of families in the city at that time was 46,985.

The assessments amount to \$335,694, and, as the report shows that there were taken from the assessment rolls for the purpose of metering, places aggregating on former rolls \$12,364, this sum should be added to the "gain" as shown in table, \$4,085, to show the real gain, which is \$17,349.

There have been taken from the assessment rolls for the purpose of metering during the last four years, places whose aggregate assessments amounted to \$62,240. In addition to this there have been metered all places of business and factories that have been established in the meantime.

The aggregate upon the assessment rolls of '92-3 is still a little over \$3,000 more than that of 1888.

REPORT OF SUPERINTENDENT OF METERS AND INSPECTION.

DETROIT, January 2, 1893.

To the Board of Water Commissioners:

Gentlemen—In compliance with the rules of your honorable body, I herewith report the work done in the meter and inspection departments during the year 1892.

The following tables show the number of meters placed, the number removed, and the total number in service on the 31st day of December, 1892:

Freight, hauling, etc	98	05	408	97	197	11	244	08	948 \$
Horse, wagon, etc				· · · ·			547	24	547 9
Total	\$13,644	41	\$80,601	68	\$12,418	14	\$23,565	24	\$ 80,224

During the last year we have placed 824 meters, and adding them to the number in service on the first day of January, 1892, makes a total of 2,053 meters in service on January 1st, 1893.

Each year brings additional proof of the necessity and justice of the meter system. Nothing can be more evident than that the measurement of water to each consumer is the only true way to arrive at the proper amount each should pay. So long as there is to be a price for water there is no other way to make a just charge other than for the amount consumed. It is simply impossible to estimate waste correctly, and there is where a large proportion of the water goes to, as the quantity pumped is about 140 gallons per head per day, while in cities that are metered the quantity is about 45 gallons, and that is a large average, for some cities are much lower, especially that of the City of Liverpool, England, where it is only 13 gallons.

Some claim that they should not be restricted in the use of water by placing a meter on their premises, but we tell them it does not restrict its use. If they find it necessary to use twice as much as their neighbor there does not seem to be any good reason why they should not pay twice as much for it. If it is not just for everybody to pay for the amount consumed then the only way left would be to have each consumer pay the same amount and use much or little as the case might be without regard to cost of furnishing it. Where it might cost only a dollar to furnish a certain quantity to one person his neighbor might use what would cost ten or a hundred dollars to furnish,

and yet if they are not to pay according to the quantity consumed the latter should have his for one dollar the same as the former. Of course the hundred dollar fellow would not object, but the one who only used one dollar's worth would, for he ought not to help pay for the one who used the larger amount, and that is just what he would have to do and is what the water takers have been doing and will continue to do under the old system of estimating the quantity used. As I said before it is simply impossible to estimate the waste and in many cases very difficult indeed to estimate the legitimate uses.

With good plumbing and proper attention nobody need fear the meter. It is harmless in itself, but they must not expect it to remain quiet when the water is going to waste. It is placed there principally for the purpose of preventing the same and it is a very faithful servant, remaining on duty night and day for three hundred and sixty-five days in the year and is seldom caught napping, as quite a number of consumers can testify.

I have a few cases that are quite interesting showing the value of the meter. One firm of manufacturers who had been using from 20,000 to 25,000 cubic feet per month jumped to 235,000 cubic feet one month, and it was a mystery to know where so much water could have gone, as they had been running just the same as usual. Of course the first thing to do was to condemn the meter, as it is always looked upon as the guilty one, until proven to the contrary, but as is generally the case—as in this -the meter was not at fault. The firm had employed a new engineer and said engineer had been with them nearly a month before discovering that there was a meter on the premises They had a 2-inch service pipe leading to a tank from which they took their supply, said tank-not having an automatic shut off-when full overflowed into the sewer, and the engineer having turned on the water, thought it necessary in order to keep the tank full to leave it turned on all the time with the foregoing result, that is, consuming 225,000 cubic feet instead of 25,000 cubic feet, or eight times more than was necessary, and in all probability they would have continued to use it in the same

way had it not been for the meter. A few days ago I had a telephone from a person "to send a man to his store immediately and stop the meter." I asked him if it was going away, he said no, but he had the water all shut off from every portion of his building and the meter kept going along just the same and he wanted it stopped. On sending to examine it he found it an easy matter to stop it and did so by turning the water off in a closet in a portion of the building occupied by a tenant which he had overlooked.

It is quite a common occurrence to have the consumption reduced from 35,000 cubic feet per month to two or three hundred cubic feet in same length of time, after the first meter bill has been presented. In metering places where the rates have been paid in advance, the occupant has a month or two after placing the meter to see how much water he is using, and usually makes a wonderful reduction in the amount before he commences to pay by meter measurement.

On one assessment of \$64 per year including a block of offices and one family and a smaller building containing family and office, the larger building assessed at \$52 and the smaller one at \$12. The first two months showed a consumption of \$,800 cubic feet on the larger building, and 44,800 on the smaller one, or nearly five times more water on an assessment of \$12 than on an assessment of \$52. Of course in the smaller building it was very nearly all waste, the legitimate uses being only two or three hundred feet while the waste was from seven to thirty-five thousand feet per month caused by what we call a rod closet which does not shut off automatically and when turned on usually remains so, unless it affects the supply in other portions of the building.

Two years ago your honorable body adoped a rule prohibiting any more of said closets being put in, and I think it would be a move in the right direction to order all now in use changed to self-acting ones of some kind; either that or place a meter on them.

There are quite a number of places we would like to meter were it not for the expense. In former years the number of

connections for each building was not limited, so that in case the owner wanted water in some portion of his premises where he could make connection with the main pipe at a less cost than he could make the extension from the one already in, he was allowed to do so; and now when we want to meter the premises we find as many as three connections requiring three meters, where the whole amount of water used could easily be supplied through one &-inch connection. I should think it advisable in such cases to compel the owner to connect his pipes in such a manner as to take his whole supply through one pipe where it is practical to do so, or else make a minimum charge for each meter, which would-in many cases-produce the same results, but as it is at present, with a minimum price for total amount consumed, regardless of the number of meters, permits the consumer to ask for a meter on each connection, without any extra charge.

During the last year we have metered all new connections to be used for manufacturing and other business purposes together with stores and business places where the assessment was \$9 per year or upwards. Nine dollars being the present minimum price per year for each premise metered we have not placed them on premises where the assessment has been less than that amount in order not to increase the assessment unless the consumption warranted it. But our examiners find a large waste in many places where the assessment is only five or six dollars per year, and I think it would be wise to make a smaller minimum rate so that all such places could be metered.

INSPECTION.

In this department, we still continue the house to house inspection, but with only four examiners instead of five, as last year. About one-third of their time is occupied in reading meters and delivering bills each month. As the work in the meter department increased, one of the examiners was transferred permanently to said department, thinking the four remaining would be able to give all the time necessary for the examination of leaks, but so much of their time has been taken up in the reading of meters and delivering bills that they have not been able to get over the city twice as in former years, which, I think, accounts for the increased percentage of leaks reported.

They have made 50,288 examinations, reported 3,335 leaks, of which 3,053 were repaired and 282 ordered shut off for failing to comply with notice. The percentage of leaks reported to number of examinations made in 1891 was 4.77 per cent., and in 1892 it was 6.63 per cent., showing that it will be necessary, in order to keep the waste from increasing on unmetered premises, to make at least two examinations throughout the city each year.

The same course has been followed as last year. The occupant has been given a stated time to repair the leak, and at the expiration of said time, if the repairs are not made, the water is ordered shut off, unless it was in two or three cases where the owners were in destitute circumstances and not able to make the repairs, and to have shut the water off would have been cruel. In those cases we made the repairs ourselves with the men employed in the leak department, and at times when they were not busy with other work.

The change made early in the year in regard to plumbers' license—that is, giving all plumbers a first-class license and then holding them to a rigid compliance with our rules and regulations governing plumbers and plumbing—has given good satisfaction to the plumbers and caused everything to move without friction in this department. I think there is better plumbing being done throughout the city than ever before—that is, so far as our inspection extends. As we have nothing to do with the sanitary part of it, we have paid very little attention to that portion of the plumbing, but, from what we have seen, think there is a great field for the proper authorities to labor in. The owners, in most cases, appreciate our efforts to have that portion of the plumbing over which we have control done to our satisfaction, but occasionally we find a person who insists on having his plumbing done to suit himself, regardless of our rules—such as using any kind of lead or iron pipe, putting in connections for each building was not limited, so that in case the owner wanted water in some portion of his premises where he could make connection with the main pipe at a less cost than he could make the extension from the one already in, he was allowed to do so; and now when we want to meter the premises we find as many as three connections requiring three meters, where the whole amount of water used could easily be supplied through one g-inch connection. I should think it advisable in such cases to compel the owner to connect his pipes in such a manner as to take his whole supply through one pipe where it is practical to do so, or else make a minimum charge for each meter, which would-in many cases-produce the same results, but as it is at present, with a minimum price for total amount consumed, regardless of the number of meters, permits the consumer to ask for a meter on each connection, without any extra charge.

During the last year we have metered all new connections to be used for manufacturing and other business purposes together with stores and business places where the assessment was \$9 per year or upwards. Nine dollars being the present minimum price per year for each premise metered we have not placed them on premises where the assessment has been less than that amount in order not to increase the assessment unless the consumption warranted it. But our examiners find a large waste in many places where the assessment is only five or six dollars per year, and I think it would be wise to make a smaller minimum rate so that all such places could be metered.

INSPECTION.

In this department, we still continue the house to house inspection, but with only four examiners instead of five, as last year. About one-third of their time is occupied in reading meters and delivering bills each month. As the work in the meter department increased, one of the examiners was transferred permanently to said department, thinking the four remaining would be able to give all the time necessary for the examination of leaks, but so much of their time has been taken up in the reading of meters and delivering bills that they have not been able to get over the city twice as in former years, which, I think, accounts for the increased percentage of leaks reported.

They have made 50,288 examinations, reported 3,335 leaks, of which 3,053 were repaired and 282 ordered shut off for failing to comply with notice. The percentage of leaks reported to number of examinations made in 1891 was 4.77 per cent., and in 1892 it was 6.63 per cent., showing that it will be necessary, in order to keep the waste from increasing on unmetered premises, to make at least two examinations throughout the city each year.

The same course has been followed as last year. The occupant has been given a stated time to repair the leak, and at the expiration of said time, if the repairs are not made, the water is ordered shut off, unless it was in two or three cases where the owners were in destitute circumstances and not able to make the repairs, and to have shut the water off would have been cruel. In those cases we made the repairs ourselves with the men employed in the leak department, and at times when they were not busy with other work.

The change made early in the year in regard to plumbers' license—that is, giving all plumbers a first-class license and then holding them to a rigid compliance with our rules and regulations governing plumbers and plumbing—has given good satisfaction to the plumbers and caused everything to move without friction in this department. I think there is better plumbing being done throughout the city than ever before—that is, so far as our inspection extends. As we have nothing to do with the sanitary part of it, we have paid very little attention to that portion of the plumbing, but, from what we have seen, think there is a great field for the proper authorities to labor in. The owners, in most cases, appreciate our efforts to have that portion of the plumbing over which we have control done to our satisfaction, but occasionally we find a person who insists on having his plumbing done to suit himself, regardless of our rules—such as using any kind of lead or iron pipe, putting in

any kind of fixtures and getting the work done by any tinker who comes along, making no report of the work and utterly ignoring the Water Department in every respect. In one particular instance of this kind, after we had notified the owner to have the work changed to comply with our rules, and, he refusing to do so, we attempted to shut the water off from the premises, when, as you are aware, the Water Board was served with an injunction preventing them from interfering with the water on said premises. Until the case comes to trial and is settled, we are not quite sure what rights we have in this matter, but if the Water Board does not have the right to say what material shall be used in the plumbing of buildings, order the necessary changes made when not in compliance with our rules, and also to prohibit any person without license from interfering with the water pipes in any way, then inspection would be a farce and of no earthly benefit. If all rights end at the corporation stop on the lot line, inspection would be of little use, for ninety nine per cent, of the leaks occur between the stop and the different outlets on the premises.

The following table shows the work of the examiners in the eastern and western divisions during the year 1892:

	Examinations	Leaks Reported.	Loaks Repaired.	Ordered Shut Off.
East of Woodward ave	25,009	1,871	1,716	153
West of Woodward ave	25,279	1,464	1,887	197
Total	50,988	8,885	8,068	201

The following table shows the duties performed by the inspectors of new work during the year 1892:

	Calls for Non-payment.	Shut for Non-payment.	Examined New Connections.	Examined Exten's and Fixtures.	Let on New Connections	Notified for Building Tax.	Shut for Vacancy.

TOTAL	6,861	2,183	8,5 4	2,487	1,570	607	414

Attached to this report is a complete list of tools on hand, and an itemized account of the material in stock on the 31st day of December, 1892.

In conclusion, I take great pleasure in acknowledging the uniform kindness shown me by your honorable body, and especially by the Secretary, who has upon all occasions so cheerfully given me his careful attention and advice when called upon, and who has so ably conducted the general management of the Works.

The employés under my supervision are entitled to due credit for the faithful performance of their work and their willingness to do duty at all times, either day or night, when called upon so to do.

All of which is respectfully submitted.

T. R. PUTNAM,
Superintendent Meters and Inspection.

REPORT OF SUPERINTENDENT OF GROUNDS.

To the Honorable Board of Water Commissioners:

Gentlemen,—As the year 1892 is drawing to a close, it becomes my duty to report to your honorable body progress during the year.

Early in the season, with the prospect of an early settlement of the Hurlbut will, your committee instructed me to beautify the grounds rather more than usual, by planting flowers and improving the roadways, and I am glad to say that the fifty or more flower beds about the grounds assisted very much to make the place attractive.

The number of visitors was largely in excess of that of former years.

The permission of the Board to allow visitors to go about over the lawn was very much appreciated and did not injure the grass during the summer months, excepting some special places, and in my opinion such places, being short cuts, should be made into good gravel paths.

The iron settees were a great convenience, and at times even there were not sufficient of them to supply the large number of visitors present.

The gravel put on the road-beds during the summer was very much needed and improved the appearance of the park wonderfully. No part of the general park work needs closer attention than the roadways, which should always be nicely edged and smoothed. Owing to the heavy loads hauled over our roadways at times, I think it would be a good plan to macadamize the main road from the avenue to the engine house. As the road already has a pretty good foundation of large stones, it would be only necessary to remove the top dressing

and build up in the usual way with stones broken the proper size, side drains being put in at the same time. We could then keep the road in good condition all seasons of the year.

The road sprinkler was not finished in time to be of any use this season, but will be a great benefit the coming summer.

Acting under instructions from your committee, I built a small green house, 12 x 106 feet, at an expense for material of one hundred and eighty-eight dollars. It will be a great convenience, although too small for very extensive floral work.

Now that the Hurlbut will is settled, I would recommend some permanent improvements. One of the first things needed is an iron fence for the Jefferson ave. front. This, I understand, has already been arranged for. It will greatly improve the appearance of the grounds, as the present fence, both in front and on each side, obstructs to a considerable extent the view of the park in approaching and passing it.

Another very much needed improvement is a ladies' toilet room, which I would advise locating south of the tower over the thirty-inch waste pipe.

I would suggest a building with the first floor fitted for the exclusive use of ladies, with a sitting room and toilet rooms, with all the ordinary toilet room fixtures at hand. Then have an outside stairway leading to the top floor for general use, which should be almost entirely glass sides, without partitions or obstructions of any kind, except necessary supports for the roof. A brick building, with stone trimmings, hardwood finish and everything complete, large enough for all purposes, could be built for about twenty-five hundred dollars.

There is also needed very badly a convenient shelter for horses and carriages.

We are now digging a ditch along the west fence from the river to a point four hundred feet south of the engineer's residence, and with three or four cross ditches hope to drain the marsh, so as to stop the growth of flags at least.

There are quite a number of maple trees set in the grounds, some of them several years ago, that will never amount to anything as ornamental shade trees, and I think it would be a good

to put elm trees in the place of them. Maples are attacked between more than any other kind of tree in the park. Altered we are continually doing what we can to promote the with of the trees, it seems impossible to get maples to do well.

I am also in favor of planting a number of evergreen trees. Although our generous benefactor, Mr. Hurlbut, did not fancy them, I think it would improve the park very much to have a hundred or so set in clumps about the grounds. Quite a number could be planted along the east line and also a few south of the basin and along the canal bank far enough away so that leaves would not be blown into the basin.

Accompanying this is an invoice of tools, etc., on hand in this department.

Respectfully submitted.

E. A. SCRIBNER, Superintendent of Grounds.

REPORT OF CHIEF ENGINEER AT PUMPING WORKS.

DETROIT, January 1, 1893.

To the Board of Water Commissioners:

GENTLEMEN — I have the honor to submit the Engineer's report for the year 1892.

The following table shows the number of gallons of water pumped, and cost of fuel for the years named:

YEAR.	GALLONS OF WATER PUMPED.	COST OF FUEL CONSUMED.	AVERAGE DAILY DELIVERED.

Engines One and Two were run part of the time with one pump attached. Cost per million gallons, \$4.27.

58,287

\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$

It will be seen by the tables the water pumped during the year is but little more than in 1891, although the city has capidly increased in population. This is accounted for by the stoppage of waste which seems to be more thorough each succeeding year.

With the new triple expansion engine and high pressure boilers which will be ready for use about July, we will be in much better condition to supply the higher districts in the city with a satisfactory head of water, and such additional as to meet any increased demand for some time to come.

In December, 1889, we began the use of natural gas for fuel and continued using it until September of this year. Our experience with natural gas was very satisfactory when the volume was sufficient, but several times it failed so suddenly that we did not have sufficient time to get steam on our cool boilers soon enough, causing a short supply of water for several minutes.

In August we began preparation for the use of fuel oil which we have been using for about three months with the most satisfactory results, being easy to control when properly applied and also a great saving over anthracite coal which has been used nearly since the building of the new works. It was found impracticable to use bituminous coal for the reason that soot would be blown into the settling basin and pumped into the mains.

Supply Company, who furnished burners as good as any we know of. Our boilers being of the fire box marine pattern, it was a question with Engineer Edwards whether the burner should go into the fire box through the furnace doors or under the boiler front which is about fourteen inches below the grate bars used for coal. He, however, decided to put them at the lower point mentioned which has proved too low, for the reason that the intense heat on the lower edge of the side sheets caused such commotion that instead of sediment depositing in the legs of the boiler as before, it has been thrown on the flues and other parts of the boiler where it bakes on, to the injury of the boilers and reducing the duty.

By advising with your committee we concluded to fit up our No. 4 boiler with oil burners set about twenty inches nearer the crown sheet and to arrange a system of bridge walls that would conduct the right volume of air to the exact point needed, and the result has been entirely satisfactory.

We get perfect combustion and also distribute the heat very evenly over the proper heating surface. Another advantage of having our boilers fitted in this way is that we can in a very few minutes change from oil to coal in case of a failure in the supply of the former. I would recommend changing those in the east room for the aforesaid reasons.

For full description of oil plant see secretary's report.

There is a certain property of fuel oil that clings to a pipe through which it flows. It cannot be called sediment for the reason that it forms evenly on the inside surface of the pipe, gradually reducing the opening until the pipe stops up completely, making it necessary to have duplicate lines between the boilers and receiving tank.

We have two duplex pumps with independent suctions and a system of pipes and valves so arranged that we can put on full boiler pressure of hot water on either of our supply lines for the purpose of cleaning them out. Hot water is far more effective than steam.

We find that fuel oil should be given as little vent as possible as oil left exposed to the atmosphere will lose its gaseous properties and become thick and almost useless for fuel.

The engines are in fair order with the exception of No. 1 engine which I hope to improve by removing a heavy weight from the fly wheel which was placed there for a balance weight when the engine was built. By placing a proper weight on the pump piston, I am confident the engine will run considerably smoother and easier.

The suction boxes of the three engines are submerged beneath the water, and at the ordinary level in the river have nearly four feet on the boxes. Early this spring, however, the water became so low that it was deemed necessary to guard against possible "loss of priming," by having hoods constructed reaching from the top of the suction boxes to within a foot of the bottom of the well. No further anxiety need be felt therefore even if the water should become four feet below the present level, which is not at all likely.

Repairs on boilers the past year have been considerable, but they are now in fair condition considering their age.

We had four of the Ford mechanical boiler cleaners put on the boilers in the east room June 1st, 1890, and on Oct. 1st, 1890, we had four put on the boilers in the west room. This boiler cleaner is simply a convenient surface blow-off and does not keep the boilers clean as they are represented to do, as we have found it necessary to use considerable boiler compound in order to maintain boilers in condition. I am sorry to say that we have not found as yet any mechanical device that will prevent scale, or any compound that will dissolve scale so that the boilers can be washed out clean, without taking out flues every two or three years.

I would suggest that hereafter all well strainers should be made of the perpendicular bar pattern instead of perforated plate, for this reason: the bar strainer can be thoroughly cleaned without delay. I would recommend having one of this pattern put into the west well where the new connection is to be made. I hope the new discharge connections will be made so that when a new discharge main is laid, either engine can be run independently with either main. The advantage of this is considerable, for the reason that only the required pressure need be kept on each main and the engines could be run slower when required without interfering one with the other, making quite a saving of fuel.

The new addition of forty-seven feet to the west end of the engine house, which is now under way, will make the building look more symmetrical and give ample room for the new engine.

The coal sheds are not in good condition, but as we are not likely to use them for some time, I see no necessity for repairing them immediately as it would be quite an expense.

Respectfully submitted,

URIAH GOULD,

Engineer.

REPORT OF THE SUPERINTENDENT OF EXTENSION AND CONSTRUCTION.

DETROIT, January 2d, 1893.

To the Board of Water Commissioners:

GENTLEMEN: In accordance with the regulations of your Honorable Body, I have the honor to present my annual report relative to the general condition and progress of the work in this department.

During the past season not less than thirty-seven miles of pipe has been laid.

It would seem from the tenor of our last year's report, that the extensions to our pipeage system would be greatly curtailed for the past year, because we expected the calls for extensions in this branch of the work would not be very numerous. We have, however, in this been doomed to disappointment, and although we are condoling ourselves with the hope that the calls upon this department of the work may not be as numerous the coming year, it is nevertheless an unknown quantity. The city now covers an area of about 29 square miles, its greatest length being about 7½ miles, and its width about 5½ miles.

Continually new streets and avenues are being opened, and outside of, and adjacent to the boundary lines of our city are many suburban sections already laid out in streets and building lots, awaiting with gaping mouths for the best of beverages from our source of supply. So in view of these facts, I fear we may not soon get a very long breathing spell; but must keep on our wearing apparel and our hands to the plow. It may be well to say right here, that owing to the great amount of paving being done the past season it has been the cause of much additional work in our extensions.

Among the chief of our lines laid the past year have been the following. The completion of the 24-inch main in the North Boulevard, from Sullivan to the west line of Grand River Avenues, and from this point on said Boulevard a 16inch main was laid to 14 feet west of the West Boulevard. A 16-inch main was laid in Buchanan Street, from the intersection of the 30 and 24-inch mains in said street and Vinewood Avenue, to Livernois Avenue, a distance of 5.550 feet. and to which all the streets and avenues have been connected thereto where water mains have been laid, and at such points where new streets have been opened, and where no pipe has as yet been called for, suitable branches have been placed for future use. The gap in the 24-inch main in Cass Street between Fort and Congress Streets was also laid. pletes the line from Fort Street to Jefferson Avenue. of 12 and 10-inch pipe has been laid in Gratiot Avenue, with good results. This line was laid from St. Aubin to Rivard Street with the 12-inch pipe, connecting with the 24-inch main in Orleans Street and to all lines crossing the same. inch pipe was laid from Rivard Street to the intersection of Gratiot avenue, Mullett and Raynor Streets, connecting with the 30-inch in Mullett Street. The laying of this line has greatly relieved the overdrawn pipes and mains in this locality. A 10-inch main was laid in Cleveland Street, from St. Aubin to Elmwood Avenues; and from Elmwood Avenue to Burlage Place, an 8-inch was laid to replace several sections of 3 and 4-inch pipe and wooden logs. This line has made an excellent cross-feed to this section of the city, the 10-inch pipe being connected with the 30-inch main in Chene Street. line of 8 and 10-inch pipe was laid in Jefferson Avenue from McClelland Avenue to about 800 feet east of the easterly city line and from this a line of 10-inch pipe was laid in the Pumping Works grounds, connecting with the 30-inch main leading to the stand-pipe.

Thirty-one lines of extensions have been made with 8-inch pipe, ranging in lengths from 100 to 3,500 feet, 12 of which were laid to replace wooden logs and 3 and 4-inch iron pipe in

the following streets and avenues: Burlage place, from Cleveland to Waterloo Streets; Calhoun Street, from Chene Street to Grandy Avenue; Eighth Street from Grand River Avenue to Brigham Street; Grandy Avenue, from Gratiot Avenue to Pierce Street; Leland Street, from Dequindre Street to McDougall Avenue; McDougall Avenue, from the north line of Gratiot Avenue to Preston Street; Russell Street, from Congress to Macomb Streets; and from Gratiot Avenue to Maple Street; Sherman Street, from Orleans to Russell Streets; Waterloo Street, from Burlage Place to Mt. Elliott Avenue; Wilkins Street, from Chene to Orleans Streets; and in alley east of Woodward Avenue, north of Gratiot Avenue; 28,985 lineal feet were laid to meet the 31 lines mentioned above, making an average of 935 feet per line.

The laying of new, and extending of the old lines of 6-inch pipe in 166 different places, have averaged about 564 lineal feet per line of pipe, ranging in lengths from 12 to 4,600 feet, or a total length of 93,580 feet.

I find by carefully looking over the records of our pipeage, that 31 new mains of streets and avenues have been added to our list of streets in which pipe has been laid, the same ranging in lengths from 50 to 2,500 feet.

It is quite probable that the calls for pipe the coming season will not exceed 12 inches in diameter as it now presents itself.

It is very gratifying to see the disappearance of some of the smaller lines of pipe, and pipe of much larger size taking its place in many of the streets and avenues of the older portions of our city. Nothing less than 6-inch is being laid north and south, and the preference will be for 8 and 10-inch pipe, seeing it is the wish of your Honorable Body that a bountiful supply shall be had in all portions of the city.

I believe we have good reason to be proud of our pipeage system, as well as the many other things about our works. We have no less than seven main lines running east and west, in sizes from 12 to 36 inches, which are supplied from the two 42-inch mains leading out from Pumping Works, and in ad-

ines mentioned are numerous lines of 8 and 10-

by the table of pipeage that about four miles ... and it are of pipe have been discontinued or taken to pipe of larger size, and where we find the w : the pipe to warrant its relaying, we do so in such and we have good reason to believe that only a war surply will be needed, and where the blocks are not

and greatly improving our pipe system by shorten-. 1 - ances between the stop gates in older lines, by a to the fewer number, when for any cause it becomes to shut off.

RECOMMENDATIONS.

would the petitions for extensions and the general work of > department not be as numerous the coming season as in he immediate past, I would respectfully recommend that the . lowing lines may be laid for main feeders, and the replacing et smaller lines of pipe with pipe of larger size.

Appended are some of the locations:

Gratiot Avenue.-A 12-inch pipe from St. Aubin Avenue to Chene Street. This will connect with the 30 inch main in Chene Street, distance 1,325 feet.

Crawford Street .- A 10-inch pipe from the 24-inch main in North Boulevard to Caniff Road, distance 7,800 feet.

Oakland Avenue.-A 10-inch pipe from the 24-inch main in North Boulevard to the northerly city line, distance 9,000 feet.

Twelfth Street -A 10-inch pipe from the 24-inch main in North Boulevard to the northerly city line, distance 5,500 feet.

The three last mentioned lines are for main feeders and to meet and cure the accumulation of dead ends of the numerous lines that are laid and are being laid in the streets and avenues east and west of Woodward Avenue in the new northerly section of our city.

Mt. Elliott Avenue.—A 10-inch pipe from Gratiot Avenue to the old city line, distance 8,000 feet, replacing about the same length of 4-inch pipe.

Rivard Street.—An 8-inch pipe from Fourth to Sixth Streets, distance, 750 feet, replacing the same length of 4-inch pipe.

John R Street.—An 8-inch pipe from Piquette Avenue to North Boulevard, distance 1,500 feet, and in said street from Miami to Adams Avenue, distance 900 feet, replacing 650 feet of 4-inch pipe.

Park Street.—An 8-inch pipe from Columbia to Peterboro Streets, distance 3,000 feet, replacing 1,300 feet of 4-inch pipe.

Rivard Street.—An 8-inch pipe from Gratiot to Palmer Avenues, distance 9,700 feet, replacing 8,000 feet of 4-inch pipe. In my recommendations for last year I had recommended the laying of a 12-inch main in this street to be laid from Gratiot Avenue to Watson Street, the purport of which was to meet the overdrawn lines in Gratiot Avenue and contiguous streets. This plan was, however, changed and the line was laid in Gratiot Avenue believing we should gain better results, which has proved to be the case.

Waterloo Street.—An 8-inch pipe from Mt. Elliott to Concord Avenue, distance 1,575 feet, replacing 900 feet of 4-inch pipe. This line is for a cross-feed which will be fed from the 10-inch main in Cleveland Street.

St. Antoine Street.—An 8-inch pipe from Gratiot Avenue to Elizabeth Street, distance 1,100 feet, replacing the same length of 4-inch pipe.

Twelfth Street.—An 8-inch pipe from River Street to Lafayette Avenue, distance 750 feet, replacing the same length of 4-inch pipe; also on said street, from Howard to Baker Streets, distance 1,475 feet, replacing the same length of 4-inch pipe.

Beaubien Street.—An 8-inch pipe from Gratiot Avenue to Watson Street, distance 4,050 feet, replacing the same length of 4-inch pipe.

Holden Avenue.—An 8-inch pipe from North Boulevard to Crawford Street, distance 3,500 feet, replacing 2,100 feet of 4-inch pipe.

M. Dougall Avenue.—An 8-inch pipe from Clinton to Gratiot

Avenue, distance 500 feet; also in said street, from Avenue to North Boulevard, distance 1,500 feet, remains 4-inch pipe.

Nabols Street.—An 8-inch pipe from Leland Street to north Larper Avenue, distance 6,750 feet, replacing 6,000 feet of pipe.

Scaufait Avenue.—An 8-inch pipe from 585 feet north of Jufferson to 282 feet north of St. Paul Avenue, distance 2,400 feet, replacing the same length of 4-inch pipe.

Relievue Avenue.—An 8-inch pipe from Gratiot Avenue to Furnsworth Street, distance 2,100 feet, replacing the same length of 4-inch pipe.

John R Street.—A 6-inch pipe from Erskine to Brady Street, distance 1,050 feet.

Holden Avenue.—A 6-inch pipe from Cass Avenue to Crawford Street, distance 1,900 feet, replacing logs.

Jerome Avenue.—A 6-inch pipe from Milwaukee Avenue to North Boulevard, distance 450 feet, replacing 450 feet of 4-inch pipe.

Piquette Avenue.—A 6-inch pipe from Beaubien to Hastings Street, distance 1,125 feet, replacing 3-inch pipe.

Leib Street.—A 6-inch pipe from Jefferson to Monroe Avenue distance 1,550 feet, replacing 3 and 4-inch pipe.

Brush Street.—A 6-inch pipe from Benton to Brady Street, distance 900 feet.

Adair Street.—A 6-inch pipe from Jefferson Avenue to Gnoin Street, distance 1,125 feet, replacing 4-inch pipe.

Walker Street.—A 6-inch pipe from Jefferson Avenue to Atwater Street, distance 1,200 feet, replacing 4-inch pipe.

Twenty-third Street.—A 6-inch pipe from Magnolia to Buchanan Street, distance 1,850 feet, replacing 3 and 4-inch pipe.

Twenty-fifth Street.—A 6-inch pipe from Baker to Howard Street, distance 1,650 feet, replacing 4-inch pipe; also in said

street from Michigan Avenue to E Street, distance 825 feet, replacing 750 feet of 4-inch pipe.

Wabash Avenue.—A 6 or 8-inch pipe from Grand River Avenue to Lake Shore R. R., distance 2,500 feet, replacing log pipe.

Seventeeth Street.—A 6-inch pipe from Poplar to Buchanan Streets, distance 500 feet, replacing 4-inch pipe.

I have, in addition to the above lines, recommended several received from Mr. Tryon, secretary of the Fire Department, which I herewith append:

The first calls for a line of pipe in Elizabeth Street from Cass to Grand River Avenue, distance 485 feet. I see but one objection to this, and that is, it would necessitate the taking up of the new brick pavement in Grand River Avenue. We could, however, lay a 6 or 8-inch pipe in said street from Cass to the north line of Grand River Avenue and leave the end dead for a time.

The second calls for a large main in State street from Washington avenue to Cass street, distance 600 feet. This should be a 10-inch pipe.

The third calls for larger pipe in Park place from Michigan avenue to Grand River avenue. As the block between Michigan avenue and State street is a short one, the better plan would be to run from State to Clifford streets, distance 750 feet. This would connect with the new 10-inch in State street, old 8-inch in Grand River avenue and to a proposed 10-inch which may be laid in Clifford street. This would be an 8-inch line.

The fourth calls for pipe in Bagley avenue from Cass to Park streets, distance 1,050 feet. I think this would be much better met by laying a line of 10-inch pipe in Clifford street from Washington to Adams avenues. This would not only meet Bagley avenue, but Middle street and Adams avenue. This will shorten the 150 feet and will be fed from the 12-inch in Clifford street and the 10-inch in Washington avenue.

The fifth call is for the replacing of the logs in Wabash avenue. This has already been mentioned.

The sixth calls for pipe in Kirby, Warren and Forest avenues,

from Grand River to Cass avenues. The total length is about 20,000 feet, and when laid in this way it will have no special feeders. A much better plan to meet this call would be the laying of a 10 or 12-inch pipe in Commonwealth avenue from the 30-inch main in Brigham street and connecting there to run northerly to Kirby avenue. This distance is about 3,200 feet. And in Kirby avenue, for a cross feeder, lay an 8 or 10-inch pipe from Grand River to Cass avenues, distance 7,800 feet. By laying in this way we have to contend with less pavement, old or new, and will have a much better supply of water and will take 9,000 feet less pipe, all crossings, whether large or small pipe, being connected to these lines and the dead ends cured.

The seventh calls for pipe in Piquette avenue from Lincoln avenue to Twelfth street, distance 1,650 feet. This can be better met by filling the gaps in Trumbull and Commonwealth avenues. This will only require the laying of 1,300 feet.

The eighth calls for pipe in Fort street, from Randolph to St. Antoine streets, distance 1,175 feet; Monroe avenue, from Farrar to St. Antoine streets, distance 1,500 feet, and in Macomb street, from Randolph to St. Antoine streets, distance 1,175 feet. If laid, 6 or 8-inch pipe will answer this call

The ninth calls for a better supply of water in the vicinity of the D. & M. Junction. This can be met by laying a 10-inch pipe in St. Aubin avenue from Trombly avenue to Pallister road. This will have a direct connection and feed from the 24-inch main in the N. Boulevard, distance 2,250 feet.

The above lines would take about 21 miles of pipe. This is a large amount, and may not be laid the coming season, should it be complied with; and yet not one of the lines mentioned but that should be laid in the very near future.

I am sorry to learn that the Detroit Pipe Foundry has closed its works and possibly may not resume operations again. Our dealings with this firm have been very satisfactory, and the foundry being in our city, it has given us a better opportunity of examining and testing the pipe before delivery by our inspector; and when any changes in our Works have made it necessary to change the size of our pipe, this has been complied within a very prompt manner. The closing of the said foundry before our season's work was done has been the cause of some delay in closing up our work for the year, having had to complete our orders for pipe outside of our city.

I take the liberty of placing before the readers of our annual reports a few facts which, I think, may be of special interest to them. They are the following: At the close of the year 1877, and including the work of that year, we had in connection with the Works 104 miles of iron pipe and 893_{5280}^{5280} miles of log pipe. At the close of the year just passed, it will be seen by the tables of pipeage we have now 426_{5280}^{1939} miles of iron pipe and only 5_{5280}^{879} miles of log pipe, which has quadrupled our iron pipe and lessened the log pipe eighteen fold, and increased the total size of pipe per mileage of all sizes above 4 inches $4\frac{1}{3}$ times greater, or 433 per cent., the greater percentage of which has been for the replacing of logs, 3 and 4-inch pipe and in many of the streets in which no pipe had been laid in the business portions of our city, either for better fire protection or a more bountiful supply of water for manufacturing purposes.

PIPEAGE.

The amount of distribution pipe and mains laid and relaid, and iron and wood pipe discontinued during the past season, is as follows: Total iron pipe laid and relaid $37\frac{2000}{5000}$ miles, of which 1,495 feet was relaid, and 1,575 feet was laid for private use; $3\frac{1}{5}\frac{600}{500}$ miles of wood and $4\frac{5}{5}\frac{400}{500}$ miles of iron pipe were discontinued, making the net increase of the pipeage $29\frac{3000}{5000}$ miles. This amount added to the measured lines of iron and wood pipe connected with the Works, will make the total length $431\frac{6000}{5000}$ miles, of which $426\frac{10000}{5000}$ miles are iron and 50000 miles are wood pipe, which in detail is as follows:

Sizi, of Pipe is locules.	MEASURED LENGTH IN FEET, FOR 1891.	ADDED LENGTH IN FEET, 1892.	DISCONTINUED LENGTH IN FRET, 1892.	TOTAL LENGTH IN FRET FOR 1992.

During the past year, 739 gates have been set, and 70 re-set; 149 gates were taken out; of the 739 gates set 121 were for blow-offs, 32 were new and 89 old gates. Of the 70 re-set 60 were blow-offs, and of the 149 gates taken out 62 were blow-offs; the balance were replaced with gates of larger size on lines where the small pipe had been replaced with larger lines.

There are now 4,374 stop-gates in use in the mains, and distribution pipes, ranging in size from 3 to 42 inches, and averaging 1 in 515 feet of pipe. In addition to this number

we have 611 blow-gates, in sizes from 3 to 24 inches. These are not all located at dead ends, but are set at points on our mains, where flushing at times becomes necessary.

The appended table gives the length of 3, 4 and 6-inch pipe, and logs which have been replaced with pipe of larger size, in detail, as follows:

	812	E OF	PIPE LAID.	SIZE OF PIPE AND LOGS REPLACED.	LENGTH OF F	'IPE

There were connected with the water mains 324 hydrants and 40 reservoirs, making the total number now in use 2,292 hydrants and 479 reservoirs. One hundred and eighty-six branches were set for the fire department and 433 street branches, ranging in size from 4 to 24 inches.

TABLE OF SERVICE CONNECTIONS.

Number of taps with iron and wood pipe of sizes from a inches to 6 inches, in detail as follows:

REPAIRS DEPARTMENT.

re past year, this department has lost its chief forere person of Mr. T. Shaughnessey, who was taken a ranks by death. He had been in the employ of the the over twenty years, and had proved a very valuable

The racancy has been filled by Mr. John Wallace, who was see it car inspectors. He is filling the position with much the works is himself and the Works. Mr. Wallace's employment with the Works has been of long standing, having had considerable experience in this department.

i am glad to say no very serious breaks have occurred in our are mains the past season. It is true, however, that we have to take out a defective branch in one of our 42-inch mains at the Pumping Works. This was an abandoned branch, the Tend being defective. This was taken out and a straight piece inserted and sleeved up.

PUMPING WORKS.

To facilitate the better working of the engines at the Pumping Works, a 20-inch globe regulator valve was inserted in the 30-inch branch line connecting the two lines of 42-inch mains and the stand-pipe. Prior to this, the adjustment of the engines and mains was made by a partial closing of the 30-inch stop gate on this branch line, the discs of which being loose in the cages carrying them, kept up a continual rattle, and fears were had that the seats would become so defaced, that when needing a perfect shut-off between the mains and stand-pipe we should be unable to do so. It is very gratifying to know that by the placing of this regulator valve it has met our needs. An 8-inch automatic relief valve, with its adjuncts, was attached to this pipe when inserting the said valve.

Engine and Boiler House Extension.—This combination of engine and boiler house is being extended at the west end to give room for the fourth engine and a battery of four boilers. This extension of the engine house proper will give a more symmetrical appearance to the building. It will be remembered that, before this extension, the building had rather a lop-sided appearance, a similar extension having been built on the east side some years ago for the third engine. The original design of the house was for two engines only, and when it should become necessary to add a third engine an additional house should be built on the west half of the grounds. The interior of the engine house proper will have a floor space of 12,937.5 feet. The inside measures 69 x 187.5 feet.

Force Mains.—Plans and specifications have been made for pipe and specials for the connecting of the new No. 4 engine with our two lines of 42-inch mains. The arrangement of the plan for connecting said engine and mains is rather unique, the arrangement being such that this engine can be run in connection with, or independent of, either of the other three engines, and can be used jointly with either of the two mains or otherwise, and when a third main is added, the arrangement is also such that it can be used in the same manner with this third main also. The specials for this work are being made by the Frontier Iron Works, and the 42-inch gates and checkvalve, by the Murdock Valve Co.

Conduits.—Plans and specifications have been made for a five-foot cylinder brick conduit. This conduit is to convey the water from the settling basin to the new No. 4 engine. The lower or south end will connect with the west gate and and strainer well of No. 1 effluent conduit. The upper or north end will connect direct to the suction pipe of said engine. This work will be commenced as soon as the weather will permit.

Messrs. Langley and Jayne have the contract for this work. The box sluice-gate and specials for the same are being made by The Russel Wheel & Foundry Co

Surface Inlet.—No extension was made to this inlet as was recommended. I think this may be delayed for some time, as I have reason to believe that with our three inlets we need not fear any very serious trouble from anchor ice. The combined area of the three equals 76 square feet or nearly 10 feet in diameter.

The laying of the No. 1 inlet pipe which was contracted for in 1891, but which was not quite finished at its close, has been completed the past year.

The plan which Mr. Case mentions in our last year's report, of spanning the settling basin with a wire net-work of strainers, is a good one, and one in which I fully accord, and when I can give it the attention due to its merits, I shall make such plans as may meet this end.

In closing this report it is only courtcous to say that the help in the office of my department has been very efficient and the co-operation with the other departments very harmonious.

Transmitted with this report are the locations of the pipes, mains and gates; also inventory of pipe, special castings and tools on hand to January 3, 1893.

Respectfully submitted,

HENRY BRIDGE,

Superintendent of Extension and Construction.

Parts per Million.

The first column gives my analysis made in 1861, before we had reached the fine estimation of Albuminoid Ammonia, the process not having been even dreamed of then. I cannot understand how Dr. Lyons' analysis shows so much Albuminoid Ammonia per million parts, as Prof. Prescott's and my analysis do not show anything like that amount. The season of the year and the condition of Lake St. Clair and its tributary

streams will influence that greatly. Albuminoid Ammonia does not point to any sewage contamination necessarily, but should there be any suspicions that the water was receiving sewage, then it should be a guide as to the quantity. I think, coupled with estimations of chlorides, nitrates, nitrites, etc., that a pretty fair opinion can be formed of the water. Next year I will take water at different points in the river, and especially about the time of spring freshets. The water now is very pure, but we cannot say it will read as well when the spring storms come. I think that the typhoids which show themselves in our city must originate from either bad drainage, sewage or from bad water drunk outside our city.

Yours respectfully,

SAMUEL P. DUFFIELD, M.D.,

Health Officer.

ANALYSES OF DETROIT ICE AND DRINKING WATER.*

BY J. E. CLARE, M. D.,

Professor of Chemistry and Physics, Detroit College of Medicine, and Professor of Chemistry and Toxicology, Department of Pharmacy, Detroit College of Medicine.

I wish to present to this society, for its materation to night, the result of numer-smalless conducted by myself and as the state, during the past year, on the ice water supply of our city, for the purse of determining, so far as the chemist determine, the healthfulness of the molt.

pply.
The work has been laborious but interthe and we trust that, in giving it to epublic, its results may be in some de-

appreciated.

The malyses of water are from samples has from hydrants during the different mans of the year, and are not the result see but of many analyses. The details it he various analyses would be tedious in interesting, so I have confined myrito giving the maximum and minimum monas found. The mean can be readily mind at. The variation of the two exams was but .002 parts per million of mona, showing a remarkable constancy the purity of our water supply.

I cannot say as much, however, for our supply. The majority of the samples are good, but some were evidently consisted by sewage. This is a matter siy under control of the proper authorise, and should receive the attention its portance demands. Some of the samples its were obtained directly from dealers of the meat shops, in different parts of the city.

k, is different parts of the city.

A pure water supply is easily rendered

miles, if, during the months we are prone to sickness, it is contaminated

ha a foreign source.

h these analyses I sought for indications it was contamination, but with the extense of two samples of ice, I found no ideace to support such a theory. Recent estigations have shown that the real

danger to health lies not so much in the substances found by the chemist in his investigations, which are per se harmless, but in certain micro-organisms beyond the domain of purely chemical investigations, and it had become somewhat the fashion to lessen the importance attached to a chemical analysis, until it was shown that the liability of the presence of pathological micro-organisms was in direct ratio to the chemical impurity of the water, viz., its fitness to sustain them.

Thus, while a chemical analysis does not positively isolate a typhoid fever cause, it demonstrates very clearly the possibility of its existence in a given water. A water containing neither ammonia, free or in combination, nor chlorine can never devèlop a case of typhoid fever. These germs are always accompanied by organic matter, the nature of which determined by the chemist gives its origin and significence.

In the analyses my first endeavor was to discover any organic contamination which might inferentially lead to a suspicion of sewage pollution, such as free and albu-

minoid ammonia.

Secondly, to find water which might in itself be considered as dangerous, or as giving positive evidence of sewage contamination, such as chlorine. In Detroit river water, chlorine in any marked quantity cannot come from an innocent source, its presence therefore must be accepted as evidence of sewage. The amount of chlorine found, 2.0 parts per million, in our water can easily arise from an innocent cause, but the amount found in a sample of ice, 65 parts per million, can only be accounted for on the supposition of an admixture of animal excrets.

I have confined myself to giving the amounts of free ammonia, albuminoid ammonia, oxygen consumed and chlorine

Bead before the Detroit Chemical Society and contributed to the Pharmaceutical Era.

contained in the ice and water, these being the more important factors in determining the amount and quality of organic material present and at the same time, the probable sanitary conditions. The presence of free ammonia of itself means very little, being frequently absorbed from the atmosphere by the waters near large cities, but the additional presence of albuminoid ammonia invests it with a significance at once ap-

parent.

The story of the present dangerous contamination of drinking water is told by the amount of this substance actually present. No arbitrary rule as to the precise point at which a given sample of water becomes impure as indicated by the albuminoid ammonia present, can be established, but it is generally agreed that the classification might be somewhat as follows:

Class I.—Water of great organic purity, yielding not more than 0.041 parts of albuminoid ammonia in 1,000,000.

Class II.—Water of medium purity, yielding from 0.041 to 0.082 parts of albuminoid ammonia in 1,000,000.

Class III.—Water of doubtful purity, yielding from 0.082 to 0.123 part albuminoid ammonia in 1,000,000.

Class IV.—Impure water, yeliding more than 0.128 albuminoid ammonia to 1,000,000.

Referring to the table appended, it will be seen that the maximum amount of albuminoid ammonia found by us in our water is well within the first-class, of water of "great organic purity." Our sister city, however, (Windsor), using water from the same source, approaches very nearly Class III, "water of doubtful purity." This can be accounted for from the fact that that city's intake is from a point below the Walkerville sewer. That Windsor water contains 0.07 parts of albuminoid ammonia per million is not in itself significant, but when taken in connection with the fact that the water farther up stream contains less than half this amount, it seems to point most positively to some foreign contamination before it reaches the consumers.

I give also the amount of oxygen consumed as this bears a direct relation to the amount of organic material contained in the water and is a valuable indicator, its significance being classified by Drs. Frankland and Tidy as follows:

Class I.—Of great organic purity, absorbing not more than .50 part per million.

Class II.—Of medium purity, absornot more than 1.5 part of oxygen per lion.

Class III.—Of doubtful purity, abs ing not more than 1.5 to 2.0 part of gen per million.

Class IV.—Impure water, absormore than 2.0 parts of oxygen per mili In this particular it will be seen that

troit water is again superior, but it a be remembered that vegetable debria itself harmless, will greatly incr both the albuminoid ammonia and the gen consuming power of the wiso that to form an intelligent c ion of the value of a given w it is necessary to have a knowle of the normal waters of the vicinity, while an excess of these factors may necessarily demonstrate the impurity the water containing them, their abs from a water is proof of its purity.

Chemical analysis cannot discover noxious ingredients or ingredients in w polluted by infected sewage or ani excreta, and as it cannot thus disting between infected and non-infected sew the only perfectly safe course is to at altogether the use, for domestic purpor of water which has been polluted to excrementitious matters.

Again, referring to the table, it wil seen that the amount of chlorine four Detroit water is less than that four any other city, excepting Rochester small amount is always found in all mat waters, being derived from the son chloride (cummon sait) which is abunda distributed in all rocks and soils.

Sewage, the polluting agent most to dreaded in water, contains a large partion of chlorine, as common sait, derimostly from the liquid excreta of anis. The proportion of chlorine in uncontasted waters is very constant, here marked excess over the normal standumless otherwise accounted for, suggia direct contamination.

The analysis of Windsor water made by Anthony McGill, B. A., of Inland Revenue Department, Ottawa, (Of the American cities, by A. R. Leed

So far as the analysis of the ice is cerned, it must be borne in mind that impurities found do not indicate the a age existing in the mass of water f which it was formed. Coming as it c from the surface and usually from a

m. one would expect to find a greater mity of organic vegetable debris, etc., is hypothesis of the kind can explain large amount of chlorine and corresmiter albuminoid ammonia in Nos. 5 it basics the freezing of water tends putly it. It has been found that 20 cent of the colloid and more than this late crystalloid impurities of water are

red by congelation. here are many apparently unsurmountto account for the greater imhis in the ice, such as its location near surface of the water, its liability to in its structure material washed the stmosphere by light snow or rain and the methods employed in miling and harvesting the crop. While sking the harvesting of the crop last her I frequently saw animal excreta, he liquid and solid, dropped upon the no special effort other than a shovel want to remove it. Ice men, in their Risterests, should see to it that no rough ept are thus made to purify it, but should condemn it and all ice in its mediate vicinity. A piece of ice of this were coming into the hands of the chemwould furnish evidence to condemn tons otherwise pure material. Good ice louid be as Dure as our drinking water. Nichols concluded that it should ext to no chlorine, and should yield k more than .05 of albuminoid ammonia million.

is these analyses I have been ably as-

sisted by W. H. Allen, Ph. C., of the Department of Pharmacy of the Detroit College of Medicine. and others, to whom my thanks are due.

The methods followed were: For the free ammonia, Nesslers's solution to the distillate; for the albuminoid ammonia, potassium permanganate and sodium hydrate, afterwards nesslerizing the distillate; for the quantitity of oxygen consumed in three hours, I followed Forehammer's process.

The chlorine present cannot be estimated in our waters except in concentrated solution, made by evaporating considerable quantities of the water. In some samples of the ice, however, the estimation could be readily effected without evaporation.

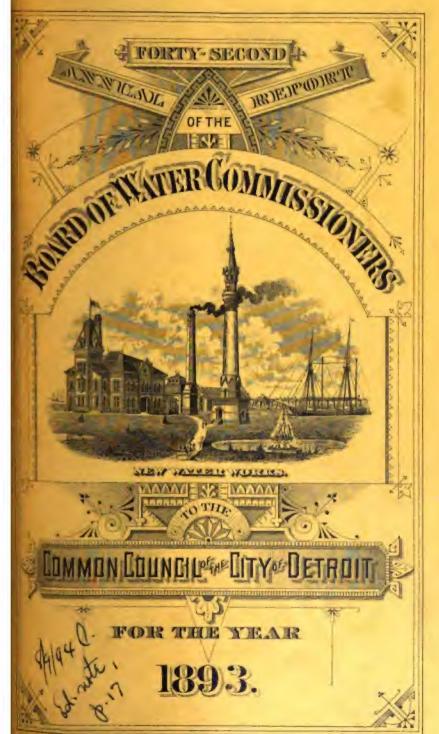

be readily effected without evaporation.

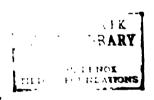

In April, 1891, I was employed by the Detroit Roening Journal to make a comparative analysis of Windsor and Detroit water supply. In looking up my notes I find the analysis of Windsor water to be as follows. It was very variable, depending upon the direction of the wind and the day of the week. The maximum and minimum of my analysis were as follows:

•	Parts per Million.
Free ammonia—Maximum	
" —Minimum	
Albuminoid ammonia-Maximu	m
· · · · — Minimu	m08
Chlorine (one analysis)	3.80

The result of my analyses demonstrates clearly that the water supply of our city is unexcelled for purity by that supplied to any other large city in the union.

REPORT

OF THE

BOARD OF WATER COMMISSIONERS

OF THE

CITY OF DETROIT.

WATER COMMISSIONERS' OFFICE,

DETROIT, January 30th, 1894.

To the Common Council of the City of Detroit:

GENTLEMEN—The Board of Water Commissioners respectfully submit their annual report for the year ending December 31st, 1893. The reports of their subordinate officers, covering in detail the operations of the Board, are in the hands of the printer, and will be presented to your honorable body immediately upon their completion.

As reported in our last annual report, the litigations growing out of the Hurlbut will had then been adjusted, and therefore your Commissioners were at liberty to enter upon certain expenditures to improve and beautify the Water Works Park.

During the last year an iron fence, running along the entire frontage of the grounds and one hundred feet back from the front upon each side, has been constructed. A contract has also been entered into for the construction of a gateway costing \$30,000. This was designed to be a memorial tribute to Mr. Hurlbut, and for this reason is styled, and the words

FUET-SHOOKD ANNUAL REPORT OF THE

The Hurlbut Memorial Gate." This

completed at the present time. together with others being reade in foral display, the planting of orna and trees, and the reclaiming of the researchy

In the state western frontage on the river, n a naistare canal and islands, will render the park fully as interesting as any in the city.

contracted for about one year ago is very

New year, \$146,000 of bonds came due. It became the redemption of these bonds, to effect a loan men included and which was done by procuring the

bonds to that amount and for the said time at six

the expenses during the past year for general construction The readjustment of our pipesge system, the which will be found in the Civil Engineer's report, secomplished at an expense of about \$78,000. attained are very apparent to many of the consumers, the bare hitherto been much annoyed by short supplies and pressures, and are fully set forth in the report above

We have labored to meet the fullest needs of the city, and at the same time preserve the economy of our administration. witered to. The results, as set forth in the following comparative statement for the years 1888 to 1893, fully justify this statement:

for the years 1888 to	Population	Operating Expenses.
YEARS. 180 180 180 180 180 180 180	980,001 940,5 68 987,050	\$93,783 50 93,931 00 95,746 85 88,086 66 91,534 83 93 031 40

From this it appears that with a population in 1893 of 62,000 more people to supply than in 1888, with all the attendant growth of manufacturing and business interests, the operating expenses were more than \$1,700 less than in 1888. Almost all this saving is attributable to the use of meters by all large consumers. Upon a conservative estimate, the annual saving from the use of meters alone is not less than \$50,000. This is not only a saving in the expense to the city, but, with very few exceptions, a reduction of the cost to manufacturers and metered consumers.

The suggestion that is made to abolish water rates and raise the necessary expenses of a water supply by general taxation, will, upon reflection, be seen to be so utterly impracticable and chimerical that it does not merit discussion.

The detailed statement of expenditures already submitted to your honorable body, for the year 1893, and those regularly submitted every January for each previous year, prove conclusively that no public funds have been used by this Board to influence any proposed legislation respecting the Board, and the undersigned supplement this evidence with their several denials that anything of the kind has ever occurred during their respective terms of office, and repudiate any statements or insinuations to that effect as wholly false and without any justification. Whatever may be the case in other departments of the municipal government, the Board of Water Commissioners cannot be pilloried in court for unlawfully using its funds with the legislature, or for any purposes foreign to the object for which it was created.

All of which is respectfully submitted.

AUGUST GOEBEL, SAMUEL G. CASKEY, HENRY M. DUFFIELD, FRANK E. KIRBY, JOSEPH L. HUDSON,

Commissioners.

REPORT

OF THE

GENERAL SUPERINTENDENT AND SECRETARY.

JANUARY 2d, 1894.

To the Board of Water Commissioners:

Gentlemen—I respectfully submit my report of the general operation and construction of the works for the preceding year, together with statements of the financial transactions of the Board.

CONSTRUCTION.

The construction of the works may be divided into two classes, ordinary and extraordinary. The ordinary construction is that which is included in the extension of pipe to keep pace with the growth of the city, the purchase and placing of meters, and such other incidentals as naturally occur in each department. The extraordinary is the laying of large supply mains, the purchase of new machinery, and the erection of buildings, in fact what may be called the enlargement of the works.

The entire expenditures for construction were \$378,048.94, of which \$210,152.52 was for extraordinary construction, less \$11,000, excess of pipe on hand this year over last. This amount includes \$110,572.47 expended at the pumping works for the new engine, the enlargement of the engine and boiler houses, the building of a new conduit, and the rearrangement and addition to the system of force mains within the grounds. Additional to this is the expenditure of \$22,049.56, chargeable to the Hurlbut Fund, and expended for the construction of the iron fence, the Hurlbut Memorial Gateway, and the general improvement and care of the grounds, making the total of extraordinary construction \$232,202.08.

It includes about \$78,634.45 expended in readjusting the general

PIPEAGE SYSTEM.

In my report for the year 1891, I referred at some length to the great differences in pressures throughout the city. I stated that I had placed, through the courtesy of the Fire Department, in different engine houses, thirteen pressure gauges, and had had a record made of their readings every hour.

This idea was the outgrowth of numerous and constant complaints having been made to me of short supplies and low pressures in certain localities, and was adopted simply to obtain absolute and reliable information.

I reported also at that time that certain gates controlling the supply of water to these localities where the pressures were unusually large had been partially closed, which had the effect only of partially curing the evil.

With the very limited knowledge of engineering that I possessed, or was had by any of the then employes of the Board, it was impossible to arrive at the true cause that was producing this unhealthy condition, and not knowing the cause, it was impossible to cure it. This condition continued to exist, with but little variation, during the succeeding year of 1892. Early in the year just passed, a civil engineer was employed by the Board, and reported to me for duty. I requested him to commence an immediate and thorough study of our entire pipeage system. I gave him the data I had collected, and asked him to report to me the results of his labors as soon as he possibly could.

That report was received and read to your honorable body, showing conclusively the mistakes that had been made and the steps necessary to take to remedy the evil.

His recommendations were concurred in, and he was instructed to carry out his plan for the rearrangement of the system.

This work and the results therefrom are best understood from his own report. I will simply refer you to the following

REPORT

OF THE

GENERAL SUPERINTENDENT AND SECRETARY.

JANUARY 2d, 1894.

To the Board of Water Commissioners:

GENTLEMEN—I respectfully submit my report of the general operation and construction of the works for the preceding year, together with statements of the financial transactions of the Board.

CONSTRUCTION.

The construction of the works may be divided into two classes, ordinary and extraordinary. The ordinary construction is that which is included in the extension of pipe to keep pace with the growth of the city, the purchase and placing of meters, and such other incidentals as naturally occur in each department. The extraordinary is the laying of large supply mains, the purchase of new machinery, and the erection of buildings, in fact what may be called the enlargement of the works.

The entire expenditures for construction were \$378,048.94, of which \$210,152.52 was for extraordinary construction, less \$11,000, excess of pipe on hand this year over last. This amount includes \$110,572.47 expended at the pumping works for the new engine, the enlargement of the engine and boiler houses, the building of a new conduit, and the rearrangement and addition to the system of force mains within the grounds. Additional to this is the expenditure of \$22,049.56, chargeable to the Hurlbut Fund, and expended for the construction of the iron fence, the Hurlbut Memorial Gateway, and the general improvement and care of the grounds, making the total of extraordinary construction \$232,202.08.

It includes about \$78,634.45 expended in readjusting the general

PIPEAGE SYSTEM.

In my report for the year 1891, I referred at some length to the great differences in pressures throughout the city. I stated that I had placed, through the courtesy of the Fire Department, in different engine houses, thirteen pressure gauges, and had a record made of their readings every hour.

This idea was the outgrowth of numerous and constant complaints having been made to me of short supplies and low pressures in certain localities, and was adopted simply to obtain absolute and reliable information.

I reported also at that time that certain gates controlling the supply of water to these localities where the pressures were unusually large had been partially closed, which had the effect only of partially curing the evil.

With the very limited knowledge of engineering that I possessed, or was had by any of the then employes of the Board, it was impossible to arrive at the true cause that was producing this unhealthy condition, and not knowing the cause, it was impossible to cure it. This condition continued to exist, with but little variation, during the succeeding year of 1892. Early in the year just passed, a civil engineer was employed by the Board, and reported to me for duty. I requested him to commence an immediate and thorough study of our entire pipeage system. I gave him the data I had collected, and asked him to report to me the results of his labors as soon as he possibly could.

That report was received and read to your honorable body, showing conclusively the mistakes that had been made and the steps necessary to take to remedy the evil.

His recommendations were concurred in, and he was instructed to carry out his plan for the rearrangement of the system.

This work and the results therefrom are best understood from his own report. I will simply refer you to the following

REPORT

OF THE

GENERAL SUPERINTENDENT AND SECRETARY.

JANUARY 2d, 1894.

To the Board of Water Commissioners:

GENTLEMEN—I respectfully submit my report of the general operation and construction of the works for the preceding year, together with statements of the financial transactions of the Board.

CONSTRUCTION.

The construction of the works may be divided into two classes, ordinary and extraordinary. The ordinary construction is that which is included in the extension of pipe to keep pace with the growth of the city, the purchase and placing of meters, and such other incidentals as naturally occur in each department. The extraordinary is the laying of large supply mains, the purchase of new machinery, and the erection of buildings, in fact what may be called the enlargement of the works.

The entire expenditures for construction were \$378,048.94, of which \$210,152.52 was for extraordinary construction, less \$11,000, excess of pipe on hand this year over last. This amount includes \$110,572.47 expended at the pumping works for the new engine, the enlargement of the engine and boiler houses, the building of a new conduit, and the rearrangement and addition to the system of force mains within the grounds. Additional to this is the expenditure of \$22,049.56, chargeable to the Hurlbut Fund, and expended for the construction of the iron fence, the Hurlbut Memorial Gateway, and the general improvement and care of the grounds, making the total of extraordinary construction \$232,202.08.

It includes about \$78,634.45 expended in readjusting the general

PIPEAGE SYSTEM.

In my report for the year 1891, I referred at some length to the great differences in pressures throughout the city. I stated that I had placed, through the courtesy of the Fire Department, in different engine houses, thirteen pressure gauges, and had had a record made of their readings every hour.

This idea was the outgrowth of numerous and constant complaints having been made to me of short supplies and low pressures in certain localities, and was adopted simply to obtain absolute and reliable information.

I reported also at that time that certain gates controlling the supply of water to these localities where the pressures were unusually large had been partially closed, which had the effect only of partially curing the evil.

With the very limited knowledge of engineering that I possessed, or was had by any of the then employes of the Board, it was impossible to arrive at the true cause that was producing this unhealthy condition, and not knowing the cause, it was impossible to cure it. This condition continued to exist, with but little variation, during the succeeding year of 1892. Early in the year just passed, a civil engineer was employed by the Board, and reported to me for duty. I requested him to commence an immediate and thorough study of our entire pipeage system. I gave him the data I had collected, and asked him to report to me the results of his labors as soon as he possibly could.

That report was received and read to your honorable body, showing conclusively the mistakes that had been made and the steps necessary to take to remedy the evil.

His recommendations were concurred in, and he was instructed to carry out his plan for the rearrangement of the system.

This work and the results therefrom are best understood from his own report. I will simply refer you to the following

statement, showing the elevations of water before and after the changes in the system had been made:

Location.	FORMER ELEVATIONS.	PRESENT ELEVATIONS.		
Corner Russell st. and Ferry ave	22.6 feet.	28.6 feet.		
Alexandrine and Cass aves	81.2 "	48.1 "		
Russell and High sts	29.8 "	41.6		
Gratiot and Grandy aves		45.5 "		
Grand River ave. and Sixteenth st	84.9 "	39.8 "		
Woodward and Milwaukee aves	19. "	40.5		
Bagg and Sixteenth sts	44.1 "	46.7 "		
Fort st. and Elmwood ave	44.8 "	52.2		
Baker and Sixth sts	48.8 "	57.8 "		
Scotten and Michigan aves	51.5 "	52.2 "		
Hubbard ave. and Fort st	58.9 "	58.9 "		
Jefferson ave. and Randolph st	49. "	49.7 "		
Bagley ave. and Clifford st	46. "	64.4 "		

A water-works of the size and importance of Detroit, and in fact any water-works, is not complete without its civil engineer to advise and counsel with, and I congratulate the Board upon having procured one of unquestionable ability.

METERS.

The introduction of meters has continued during the past year, but not of course with as largely beneficial results as shown in the four years previous. One of the causes for this is the fact that most of the meters placed during the year were upon small consumers, the larger ones having already been metered. Up to this time meters have only been placed on business houses, stores, factories, etc., and hardly any, only by request, upon families. This fact alone would prevent any such showing as those of 1889, 1890, 1891 and 1892. Another cause for the increased amount pumped is this, that during the year the pressure of water has been materially increased. The average increase was five pounds, or what is equivalent to an extra elevation of nearly twelve feet, and twenty-eight per

cent. over the previous average. This increased pressure largely increases the quantity of water discharged through an orifice in a defective water pipe, or through a faucet purposely or accidentally left open.

The amount of water pumped each hour during the day and night indicates conclusively that during each hour about 800,000 gallons are wasted. This waste is undoubtedly very largely caused by constantly flowing streams, of greater or less size, throughout the whole system of supply, not only in defective service pipes and fixtures but in the pipeage system itself. I have already submitted this matter to the engineer and requested him to devise some means of investigating and locating the leaks that are existing in the supply and distribution mains, which will be probably attended to during the coming year. The work of the examiners under Superintendent Putnam is already accomplishing this work as far as service pipes and fixtures in houses are concerned.

I desire in this connection to introduce an article from the pen of Col. William Ludlow, a distinguished engineer of national reputation, and one who has been in a position to judge, and with an education and intellect to appreciate all of the features and influences that pertain to the subject of water supply, the necessity for preventing waste and the means that should be adopted to accomplish that result.

READ IT.

THE OPINION OF AN EXPERT.

Water waste arises from many causes—leaky mains and pipes, defective appliances of all kinds, lack of supervision of public openings, and the perpetual flow from horse-troughs, bar-rooms, hotels, private houses, etc. In addition, is the immense loss through factories and mills, where the pipes are constantly flowing, and which do not even shut off the water when the works are closed.

There are but two practicable methods of checking this waste, viz.: by a system of inspection and enforcement of penalties, and by measuring and charging for the quantity taken. The former plan involves domiciliary visiting, always cumbersome and objectionable, by an army of inspectors, subject to both obstruction and improper influences in the discharge of

their duties, and unless thoroughly systematized and maintained and aided by indirect instrumental determinations, is, in the nature of things, an approximation only to an effective method.

Actual measurement is preferable, as being more exact, automatic, effective and equitable. The water meter is merely a sleepless and tireless machine, not susceptible to bribery or violence without discovery, requiring little attention, and recording actual consumption regardless of the disposition made of the water which passes through it.

The two systems may be compared by supposing a given establishment to be furnished with gas at an annual rental, and its economical use dependent upon the carefulness of the

occupants and an occasional visit by an inspector.

It is sometimes said that water should be as "free as air," and in truth it is to any one who chooses to procure it for himself, as light is free to him who goes to bed at dark; but he who wishes either light or water supplied to him, when and where and in such amount as he shall choose, must manifestly pay for it, and the meter will enable the department to make out just bills, and at the same time hold the water-taker responsible for the waste due to carelessness, willfulness or defective appliances. When this system has been intelligently carried out, as in some of the better managed cities, such as Providence, the results show that the legitimate consumption of water for all purposes is from thirty to forty gallous.

The argument that an undesirable economy might be exercised among a class of population whose use of water should be encouraged, may be met by fixing a minimum allowance

and charging by meter for all beyond that.

It is natural, perhaps, that city officials should turn their attention to drawing from new sources and increasing the machinery of their department, rather than undertake the unpopular and thankless task of restricting waste. No one knows, who has not attempted it, how difficult it is to correct abuses of long standing. Few citizens are liberal or intelligent enough to voluntarily aid in securing a public benefit, or necessity even, if it must be accomplished at the cost of any inconvenience or restriction to themselves. Touch the purse-strings, however, and it can be done. With the meter registering waste, defective appliances will be repaired, carelessness of servants and employés corrected, the water closet will have a proper flushing tank instead of a constant flow, and the water will not be used in winter to protect a badly-laid pipe from freezing, or the owner from a plumbing bill.

The waste from these sources, though of no great apparent amount in a single instance, when multiplied by the immense number in use, represents a formidable quantity, which, having been brought at great expense from the source of supply, flows

to tide water without having served any useful purpose whatever.

[Signed]

COL. WM. LUDLOW.

HISTORICAL.

The following table is one published last year, with the addition of the results of 1893:

1890.	41,467	12,120,944,532	292,300	ing.
1891	43,933	12,057,261,236		•"y.
1892			274,470	
1893	46,400	12,276,612,482	264,582	
	49,817	13,877,977,208	278,579	

a will be seen that the average per family has increased to a size more than that of 1891, and for the reasons given previously. Although there seems to be a falling off in the good results obtained so far, yet when we consider that the total quantity pumped is still considerably less than that of 1888, notwithstanding that 13,000 families, or a population of 66,500, have been supplied in excess of that of 1888, it will be seen that the results achieved are still enormous.

The following table, showing the amount of water it is reasonable to estimate would have been pumped, upon the basis of information gained from the table preceding, and also showing the quantity actually pumped, will give the actual amount saved.

YEARS.	Families Supplied.	Would have Pumped.	Actually Pumped.	Saved.
1889	89,158	16,578,858,448	12,875,834,453	
1890,	41,467	19,042,973,844	12,120,944,582	· • • • • • • • • · · · ·
1891	43,988	21,890,320,178	12,057,261,236	
1892	46,400	25,084,675,200	12,276,612,482	
1893	49,817	29,221,157,690	13,877,977,908	•••••
In 5 Years		111,812,984,860	68,208,129,911	48.604,854,949

The above results are arrived at by taking the average increase for ten years previous to 1889, which was 8.5 per cent, and assuming that the quantity pumped would have increased each year in the same ratio. Looking back over the column, in first table presented, marked "total quantity," the assumption, or estimated quantity that would have been pumped, is instified.

FINANCIAL SAVING EFFECTED.

In my last annual report, I entered very exhaustively into a mathematical calculation of the amount saved to the Board during the years 1889, 1890, 1891 and 1892, by the introduction of meters. The actual amount saved up to January 1st, 1893, was \$235,408.35. As shown by the foregoing table, the

amount saved during the past year is greater than the average of the four years previous, notwithstanding the fact that the pro rata per family has been increased.

For the details of the operation of this department, I would respectfully refer you to the report of Supt. Putnam.

PUMPING WORKS.

The construction at the Pumping Works, above referred to, is very near completion. The use of crude oil as a fuel has been, if anything, more satisfactory than was estimated. For cleanfiness and the ease with which it is handled and used, it has no equal; and when it is considered that its cost to the Board for the year 1893 was about \$27,000, with a saving in labor o \$2,280, and that the cost of fuel in 1888 was about \$39,000, with this additional cost of labor, the financial saving by its use can be fully appreciated.

The amount expended at the works since its original establishment, including that expended on the grounds and chargeable to the Hurlbut Fund, is shown in the following table:

ITEMS.	Previously Expended.	1898.	Total.
Land	\$ 85,000 00		\$35,000 O
Force Mains	609,414 77	\$12,552 92	621,967 6
Inlet Pipes	90,626 84	ļ	90,626 8
Dock, Basin and Canal	135,309 12		135,309 13
Conduits and Wells	73,710 52	3,960 00	77,670 5
Engine, Boiler and Coal		1	
Houses	164,133 14	24,974 98	189,107 12
Stand Pipe and Tower	30,420 72		30,420 72
Pump Wells	54 ,221 56		54,221 56
Engines	265,642 24) 56,013 32	321,655 56

Grounds, Fences and Gate-	•	1	
way	54,632 32	22,890 12	77,522 44
Inspection	2,977 86		2,977 86
Miscellaneous	9,850 72	1,844 08	11,694 80
Total	\$ 1,581, 626 6 0	\$132,602 03	\$1,714,228 68

EFFECT OF WATER IN SEWERS.

Superintendent Putnam in his report speaks of the fact, that during the last year his examiners reported that in answer to their notice that water must not be allowed to run continually, they often received the information that this was done at the direction of the Board of Health.

He made some inquiries in regard thereto and found that the inspectors under the said Board were so instructing the people, saying it was to be done for the purpose of keeping the sewers clean.

It seems from the above that it is not only not generally understood, but very seldom understood, even by those whose education would indicate a knowledge of such things, that running streams in sewers have no effect whatever in dislodging and removing the depositions therein. The liquid matter in sewers is easily disposed of, in fact will care for itself, but the solid and greasy matter deposited therein cannot be disturbed unless it be by force such as is exercised by a "flush" or a sudden dump of water that will fill the sewer and rush impetuously towards an outlet.

As an illustration, last February an application was received to permit an attachment of a pipe placed in the Campbell avenue sewer where there was a considerable accumulation of solid matter in the bottom of the sewer. It was arranged so that at frequent intervals jets of water would be discharged downwards and would by mere force dislodge and break up this accumulation.

The permission was given, and a man sent to observe the conditions and measure the quantity of water consumed. One fact was startlingly corroborative of the opinion that flowing water in sewers accomplishes no good whatever towards removing solid matter deposited therein. In this sewer was found a flowing stream of over 12 inches in depth, which, instead of disturbing the solid matter beneath, was gradually yet surely increasing it by depositing matter carried along with it.

Witness the action going on continually in our water mains themselves, wherein the water occupies all the space and with a pressure in every direction of from 20 to 40 pounds to a square inch. If flowing streams can accomplish anything, they certainly ought under such conditions, and yet the fact is that there is gradually being deposited in the bottom of these pipes, from the water itself, solid matter that can only be removed by opening and closing gates in such manner as to send the water "skurrying" in the opposite direction from its usual course.

It is often complained that the use of meters, by causing an economical use of water, restricting its quantity and flow in sewers and preventing thereby a removal of the accretions therein, is directly responsible for the prevalence of diphtheria and other kindred diseases. On the contrary meters are a benefit in this direction, as they often influence the adoption and use of the tank closet as a matter of economy, which, discharging a few gallons of water at once, accomplishes more in cleaning out the waste pipe all the way to its entrance into the sewer than a running stream would accomplish in a week. The force of even such a small body of water rushing in one solid bulk through the confined area of a waste pipe will move everything before it.

At my request, Mr. Williams about the first of last October made some very interesting computations in regard to this question. He says that the best authorities agree that the velocity of flow in a sewer should be between two and three feet per second; that, assuming that our sewers are constructed correctly, the capacity of the several main sewers is 975,000 gallons per minute; and that the maximum capacity of the engines at the pumping works is only 5,400 gallons per minute, or one-eighteenth that of the sewers.

It will be seen from this that if the entire water supply were turned into the sewers that it would simply afford them running streams at their bottoms, that would accomplish nothing.

Another point he calls attention to is the fact that when

the traps are partially open to permit the flow of water, an opportunity is offered for the passage of foul gases into the building. An experience of this nature happened in New York city in one of the hospitals. The same instructions were given there by the Board of Health as here, and the presence of foul gases was soon apparent which, after an investigation, was found to be coming through the partially open traps from the sewer. Of course the orders to "let the water run for the purpose of cleaning the sewers," were immediately rescinded.

Mr. Williams also gave some interesting data in regard to rain-falls. The area of surface drained by the sewers of Detroit is about 30 square miles. Experiments show that about 20 per cent. of the rain-fall reaches the sewers.

In the 940 minute storm of October 3d there fell 1,050,274 gallons of water, 20 per cent. of which passed into the sewers, or 210,055 gallons each minute, a quantity equal to four times the maximum capacity of our works.

In fact, we owe to our rain storms the cleanly condition of our sewers, and if it is found that in certain sewers, as I presume it may be, that rains do not accomplish this desired result, then some way must be adopted of flushing the sewers, something after the manner and upon the same principle as a tank closet. Running streams will not produce any such effect.

The "fooling" with fuel at the pumping works, as a correspondent with one of the daily papers designated it, "going from coal to gas, from gas to coal, to gas again and then to oil," has had the following pecuniary effect:

YEARS.	Fuel, Labor, Lubricants, &c.	PER MILLION.
1888	\$60,284.11	\$4 19
1889	61,560.48	4.78
1890	54,488.49	4.49
1891	58,019.77	4.39
1892	53,287.89	4.27
1898	46,546.01	8.85

The comparison is most favorable between the years 1893 and 1888 and 1889, as the quantity pumped during the year 1893 was about one thousand millions more than that of 1889 and about five hundred million less than that of 1888.

WATER WORKS BONDS.

The following table shows the whole history of the bonded indebtedness of the Board, in which will be seen that the total amount of bonds issued is \$1,850,000, of which \$692,000 have already been redeemed, leaving outstanding \$1,158,000, upon which there is an annual interest of \$70,820.

				\$1,850,000		\$692,000	\$1,158,000

^{*} Running one year at 6 per cent.

As stated one year ago, on the first of last August \$146,000 of bonds, as shown above, became due and payable. In order to meet this demand it was necessary for the Board to negotiate a loan of \$75,000, which was done, and that amount of the bonds falling due were practically reissued for one year at 6 per cent. interest.

the traps are partially open to permit the flow of water, an opportunity is offered for the passage of foul gases into the building. An experience of this nature happened in New York city in one of the hospitals. The same instructions were given there by the Board of Health as here, and the presence of foul gases was soon apparent which, after an investigation, was found to be coming through the partially open traps from the sewer. Of course the orders to "let the water run for the purpose of cleaning the sewers," were immediately rescinded.

Mr. Williams also gave some interesting data in regard to rain-falls. The area of surface drained by the sewers of Detroit is about 30 square miles. Experiments show that about 20 per cent. of the rain-fall reaches the sewers.

In the 940 minute storm of October 3d there fell 1,050,274 gallons of water, 20 per cent. of which passed into the sewers, or 210,055 gallons each minute, a quantity equal to four times the maximum capacity of our works.

In fact, we owe to our rain storms the cleanly condition of our sewers, and if it is found that in certain sewers, as I presume it may be, that rains do not accomplish this desired result, then some way must be adopted of flushing the sewers, something after the manner and upon the same principle as a tank closet. Running streams will not produce any such effect.

The "fooling" with fuel at the pumping works, as a correspondent with one of the daily papers designated it, "going from coal to gas, from gas to coal, to gas again and then to oil," has had the following pecuniary effect:

YEARS.	Fuel, Labor, Lubricante, &c.	PER MILLION.
1888	\$60,284.11	\$4 19
1889	61,560.48	4.78
1890	54,488.49	4.49
1891	58,019.77	4.39
1892	58,287.89	4.97
1898	46,546.01	8.85

The comparison is most favorable between the years 1893 and 1888 and 1889, as the quantity pumped during the year 1893 was about one thousand millions more than that of 1889 and about five hundred million less than that of 1888.

WATER WORKS BONDS.

The following table shows the whole history of the bonded indebtedness of the Board, in which will be seen that the total amount of bonds issued is \$1,850,000, of which \$692,000 have already been redeemed, leaving outstanding \$1,158,000, upon which there is an annual interest of \$70,820.

^{*} Running one year at 6 per cent.

As stated one year ago, on the first of last August \$146,000 of bonds, as shown above, became due and payable. In order to meet this demand it was necessary for the Board to negotiate a loan of \$75,000, which was done, and that amount of the bonds falling due were practically reissued for one year at 6 per cent. interest.

The following table shows many details connected with the works and its operations that are of considerable interest. These details and conditions are given of the six preceding years, in order to show what has been done in the past five years by the measures adopted by the Board to prevent the waste of water.

Attention is called particularly to the last two lines of this exhibit, and a comparison invited between the years 1888 and 1893. Over \$1,700 less of "actual operating expenses" and an increase in the population of 62,803, or 32 per cent.

As will be seen by the table the per capita daily supply has increased from 140 to 148, and is explained on page 14.

The entire expense for pumping water during the year was \$46,546.01, or \$14,000 less than 1888 and \$15,000 less than 1889.

* Obtained by multiplying number of families by 5.12,

The following table is the report of the assessments made in May and June, to commence July 1, 1893.

The assessments were increased \$16,776, notwithstanding there were taken from the assessment rolls and metered, and thereafter appear upon the meter books places, the aggregate assessments upon which amounted to \$10,043, making the actual increase the sum of the two, or \$26,819.

The number of families in the city not supplied are continually decreasing, amounting now to 388. The total number of families in the city is 50,205.

To the Board of Water Commissioners:

GENTLEMEN — In accordance with the regulations of the Board we have employed J. H. Clegg, expert accountant, to make a thorough examination of the financial operations of the employees of the Board, both in the receiving and paying out of money, from the date of the last investigation up to January 1, 1894, and append herewith his report.

Yours respectfully,

(Signed) H. M. DUFFIELD,
J. L. HUDSON,

Committee on Ways and Means.

DETROIT, MICH., January 31, 1894.

To the Committee on Ways and Means, Board of Water Commissioners, Oity of Detroit:

GENTLEMEN—As instructed by your committee, I have examined the books and vouchers of the Water Works for the remainder of the year ending December 30, 1893. My report of September 5, 1893, covered the examination of the Secretary, Receiving Clerk, and Permit Clerk to May 1, 1893, the Meter Department to January 1, 1893, and the Assessors and Collectors to July 1st, 1893.

The examination just concluded covers all the officials above named from the respective dates, excepting the Assessors and Collectors.

I did not go into the details of the Assessors' and Collectors' accounts, for the reason that I consider the system of checks now in use to be a sufficient protection until the end of the assessment year (June 30, 1894), when their work can be proven. I did, however, inspect each stub book, and saw that each and all were properly certified as being correctly footed and posted by officials of other districts or departments.

I carefully examined the accounts of the Secretary, and found properly approved vouchers for all disbursements, and said disbursements were correctly charged to the various accounts.

The Receiving Clerk has accounted for all moneys paid to him, and his cash and bank balances as shown I verified and found correct.

The accounts of the Meter and Permit Clerks are also correct.

CASH STATEMENT.

REPORT OF THE CIVIL ENGINEER.

JANUARY 25, 1894.

To the Honorable Board of Water Commissioners of the City of Detroit:

GENTLEMEN—Conforming to the regulations of your Honorable Body, the Civil Engineer submits for your consideration the following report of the operations under his supervision during the year just past.

The most important subject receiving attention thus far has been the equalization and increase of pressure in our system. Until very recently the works of this city have been operated with a pressure as low as the lowest in any city of the United States. A low pressure is economical as far as the expense of operation is concerned, for the fuel consumed, other things being equal, will vary with the head pumped against, and if there be waste, it will increase as the pressure increases, though not in the same ratio. But the pressure maintained on our system appears to have been too low to satisfy the demands of our population for several years past, and what has been available has been very unfortunately distributed; while the residents in the southwest portion of the city had an abundant supply, those living in the upper Woodward and Cass Avenue district were oftentimes unable to get water into second-story bath-rooms.

Owing to the many complaints of deficient pressure, your Secretary, in July, 1891, through the courtesy of the Fire Commission, had placed in various fire engine houses about the city, pressure gauges, from which readings have been recorded every hour to the present time. For the first month the recorded pressures at the several locations were found to vary from 11.9 pounds, the lowest, to 26.9, the highest, with an average from the entire city, deduced from these

readings, and the areas of the districts which they represent of 18:02 pounds. In September of the same year this last average pressure had fallen to 16.9 pounds. During the colder months, as seen by Plate 3, page 51, it recovered itself somewhat, but in August, 1892, it had fallen to 15.4 pounds, and in January, 1893, to 15 pounds. During the eighteen months intervening between the location of the gauges and this last date, your Secretary had endeavored, by throttling certain lines, to correct the evils, and would doubtless have been successful to a considerable degree, had it not been that the extensions then under construction, were so designed as to counteract any beneficial results that were obtained. As it was, his efforts served to keep the pressure in certain localities from falling to the very unsatisfactory point it must otherwise have reached.

The Civil Engineer's connection with these works dates from the middle of last February, and at that time the study of this problem was turned over to him. Pressure readings were at once taken at ninety-seven points about the system, which are recorded in the table on page 61. A study of the topography of the city revealed that within the limits supplied by the system there is a difference of elevation of more than fifty feet, which amounts to a difference of pressure of about twenty-two pounds. In most systems this would be comparatively insignificant, so far as domestic service is concerned, but owing to the very low pressure maintained here it was of vital importance. From the fact that this low pressure, originally determined by the limited head attainable with the old reservoir system, had been adhered to for so long a time, the plumbing in our city was of a very light character in many places, and a material increase of pressure would be attended by serious breakage. Consequently when the growth of the town demanded a higher head in certain localities than could be obtained from the reservoir, and direct pumping was resorted to, the system was divided into an upper and a lower service. On the upper service about nine pounds more pressure was maintained at the engines than on the lower, and by this means it was intended to carry a very nearly uniform pressure throughout the city, as, if the flow of water were properly adjusted, there need not have been a variation of more than twelve pounds between any points of the system. From the fact that it was primarily the elevation of the ground which necessitated the adoption of this arrangement, it was to be supposed that the topography of the city would be a subject of very careful consideration in connection with the development of the plan, but actually it appears to have been entirely overlooked, for although this plan was adopted in 1886, and has been operated upon ever since, there was not to be found in the current records of the Construction Department, an elevation of a single point in the entire system at the beginning of last March. The Secretary, however, had on file in his office, the elevations of the several gauges he had located, and the records of the readings for the twenty months preceding. This information was turned over to the writer, and formed the nucleus about which the material was gathered which forms the bulk of this report.

Referring to the map of the system, opposite page 60, it will be seen that the supply from the pumping station reaches the business district through a 42-inch main in Jefferson Avenue. while the supply for the northern portion of the city flows through a similar main on Cadillac Boulevard and Mack Aveaue, and thence via Collins Street and Canfield Avenue. traverses almost the highest district in the city. Passing westward along this line it will be seen that it connects with a 24-inch main running south in Vinewood Avenue. designer, or, more properly, the developer of the system apparently at this point lost sight of two very important principles in hydraulics; first, that friction increases with the length of the channel; and, second, that water runs down hill. Had the situation been properly studied it would have appeared that instead of laying this main in Vinewood Avenue, a much more direct and level route would be obtained by connecting with some one of the down town mains to supply the southwestern district. The elevation of the corner of Vinewood Arease and Fort Street is only a few feet above the pumping which, as will be seen from the map, and the water traversing the Canfield Avenue main must pass over a hight of some fifty to arrive at an elevation of less than fifteen feet, while by reading one of the mains, as referred to above, an almost red route would have been obtained. Aside from the cost of devating the water to the hight necessary for it to flow over the hill, the loss of head due to friction was fully fifty per more by the circuitous route selected than it would have been by the other, and worse than all by the syphonic action of the water used in the low lands on that flowing over the hill, the pressure in the upper districts was very materially reduced, at some points fully thirty per cent.

It is a well known principle of hydraulics that if water flows in a tube from a higher to a lower level, whatever the path of the tube-if friction be not considered-the pressure at any point will be measured by the ordinate from the tube to the straight line joining the ends of it, so that if at any point the tube crosses this line the pressure there becomes zero and above the line a suction will exist. So in such a case if water be flowing under pressure in a pipe from a point A to a point C and there is a point B between the two at the same level as A, it will not have the same pressure as A because of the syphonic action of the water flowing away at C. This is just the condition which was produced by the above-described construction. The consumption of water in the low western part of town caused the pressure along Woodward and Cass Avenues to fall to less than three-fourths what it would have been had the water been consumed at that level instead of at the lower one.

Another error in the arrangement was in the treatment of the locality along Gratiot Avenue from Hastings Street north and east. This territory, it will be seen by the contour lines on the map, lies in almost the highest district in the city, but it was being supplied from the lower service, and the pressures obtainable were often insufficient for the needs of the manufacturing establishments there. Appeals from property own-

ers had been answered by the laying of more and larger pipe, and the Superintendent had each time reported that the static head was very materially improved, but the record of pressure in that locality shows that the head obstinately decreased from 15.2 pounds in July, 1891, to 12.5 pounds in March, 1893. remedy this last evil involved only the readjustment of the distribution in existing mains by the manipulation of the gates. This was accomplished at the end of March, and the April record showed the district to have more than recovered its lost pressure, the average being 16.6 pounds. The section in the northern part of the city required more heroic treatment, for before the difficulty there could be remedied, a new means of supplying the western part of town had to be devised. So, absurd as it may seem, a line of pipe was laid out Michigan Avenue to afford better pressure to the residents in the apper Woodward Avenue district.

Referring again to the map, it will be seen that the 130-ft. contour line, which runs from the city limits, near Wreford Street, on the west, nearly parallel with Grand River Avenue, to Bagg Street, and thence, by an easy curve, eastward, crossing Woodward Avenue near High Street, and Chene Street at Mullett Street, divides the system about equally, both as to elevation and area, and it will be further noted, that the 120-ft. line divides the lower half about equally. The 130-ft, line is the one naturally selected as the division line of the upper and lower services, and the 120-ft. line, passing, as it does, very nearly along Abbott and Tenth Streets and Michigan Avenue, led to the selection of the latter route as the line of supply for the western district. During the month of June, before this line was completed, on account of many complaints in the northern part of the city, it became necessary to cut off the western district from the Canfield Avenue main, and to supply it through the Bagg Street main. To do this, the pressure on the low service system was raised sufficiently to supply the Gratiot Avenue territory, and the supply to the central portion of town was throttled to avoid excessive pressure. Under these conditions the system was operated from June 20 to Avenue and Fort Street is only a few feet above the pumping station, as will be seen from the map, and the water traversing the Canfield Avenue main must pass over a hight of some fifty feet to arrive at an elevation of less than fifteen feet, while by extending one of the mains, as referred to above, an almost level route would have been obtained. Aside from the cost of elevating the water to the hight necessary for it to flow over the hill, the loss of head due to friction was fully fifty per cent. more by the circuitous route selected than it would have been by the other, and worse than all by the syphonic action of the water used in the low lands on that flowing over the hill, the pressure in the upper districts was very materially reduced, at some points fully thirty per cent.

It is a well known principle of hydraulics that if water flows in a tube from a higher to a lower level, whatever the path of the tube—if friction be not considered—the pressure at any point will be measured by the ordinate from the tube to the straight line joining the ends of it, so that if at any point the tube crosses this line the pressure there becomes zero and above the line a suction will exist. So in such a case if water be flowing under pressure in a pipe from a point A to a point C and there is a point B between the two at the same level as A, it will not have the same pressure as A because of the syphonic action of the water flowing away at C. This is just the condition which was produced by the above-described construction. The consumption of water in the low western part of town caused the pressure along Woodward and Cass Avenues to fall to less than three-fourths what it would have been had the water been consumed at that level instead of at the lower one.

Another error in the arrangement was in the treatment of the locality along Gratiot Avenue from Hastings Street north and east. This territory, it will be seen by the contour lines on the map, lies in almost the highest district in the city, but it was being supplied from the lower service, and the pressures obtainable were often insufficient for the needs of the manufacturing establishments there. Appeals from property owners had been answered by the laying of more and larger pipe, and the Superintendent had each time reported that the static head was very materially improved, but the record of pressure in that locality shows that the head obstinately decreased from 15.2 pounds in July, 1891, to 12.5 pounds in March, 1893. remedy this last evil involved only the readjustment of the distribution in existing mains by the manipulation of the This was accomplished at the end of March, and the April record showed the district to have more than recovered its lost pressure, the average being 16.6 pounds. in the northern part of the city required more heroic treatment, for before the difficulty there could be remedied, a new means of supplying the western part of town had to be devised. So, absurd as it may seem, a line of pipe was laid out Michigan Avenue to afford better pressure to the residents in the apper Woodward Avenue district.

Referring again to the map, it will be seen that the 130-ft. contour line, which runs from the city limits, near Wreford Street, on the west, nearly parallel with Grand River Avenue, to Bagg Street, and thence, by an easy curve, eastward, crossing Woodward Avenue near High Street, and Chene Street at Mullett Street, divides the system about equally, both as to elevation and area, and it will be further noted, that the 120-ft. line divides the lower half about equally. Another error in the arrangement was in the treatment of the locality along Gratiot Avenue from Hastings Street north and east. This territory, it will be seen by the contour lines on the map, lies in almost the highest district in the city, but it was being supplied from the lower service, and the pressures obtainable were often insufficient for the needs of the manufacturing establishments there. Appeals from property own-

ers had been answered by the laying of more and larger pipe. and the Superintendent had each time reported that the static head was very materially improved, but the record of pressure in that locality shows that the head obstinately decreased from 15.2 pounds in July, 1891, to 12.5 pounds in March, 1893. remedy this last evil involved only the readjustment of the distribution in existing mains by the manipulation of the gates. This was accomplished at the end of March, and the April record showed the district to have more than recovered its lost pressure, the average being 16.6 pounds. The section in the northern part of the city required more heroic treatment, for before the difficulty there could be remedied, a new means of supplying the western part of town had to be devised. So, absurd as it may seem, a line of pipe was laid out Michigan Avenue to afford better pressure to the residents in the ipper Woodward Avenue district.

Referring again to the map, it will be seen that the 130-ft. contour line, which runs from the city limits, near Wreford Street, on the west, nearly parallel with Grand River Avenue, to Bagg Street, and thence, by an easy curve, eastward, crossing Woodward Avenue near High Street, and Chene Street at Mullett Street, divides the system about equally, both as to elevation and area, and it will be further noted, that the 120-ft. line divides the lower half about equally. The 130-ft. line is the one naturally selected as the division line of the upper and lower services, and the 120-ft. line, passing, as it does, very nearly along Abbott and Tenth Streets and Michigan Avenue, led to the selection of the latter route as the line of supply for the western district. During the month of June, before this line was completed, on account of many complaints in the northern part of the city, it became necessary to cut off the western district from the Canfield Avenue main, and to supply it through the Bagg Street main. To do this, the pressure on the low service system was raised sufficiently to supply the Gratiot Avenue territory, and the supply to the central portion of town was throttled to avoid excessive pressure. Under these conditions the system was operated from June 20 to August 4, and the results are tabulated under the head of July. At the end of this time the Michigan Avenue line was completed and opened, when the system was readjusted to accord with the new condition. During the temporary July arrangement, it was incidentally demonstrated that while leading into the business portion of town there are two 30-inch mains, one 24-inch, one 16-inch, and one 12-inch main, the entire supply required for this portion of the city during these forty-five days, could be brought through one 30-inch main, with a gate in it closed to within one-fourth of the bottom of its opening. It therefore appears that the center of town is abundantly supplied with large pipe.

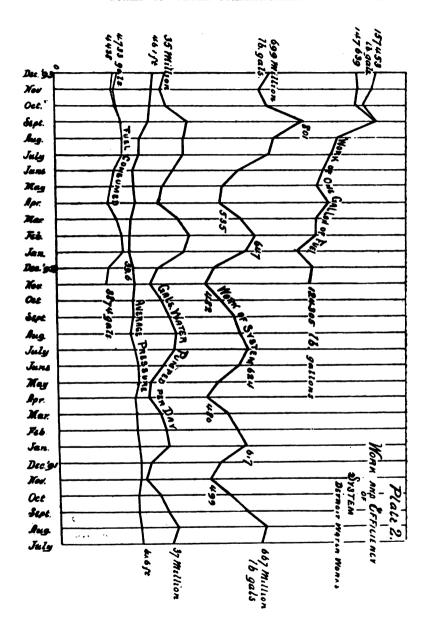

Upon the completion of the Michigan Avenue line, our attention was chiefly devoted to the construction of a 10-inch main along the eastern river front, for the better fire protection of the large manufacturing interests in that vicinity. This line was connected with the Jefferson Avenue 42-inch main at the corner of Meldrum Avenue, and thence was laid south on Meldrum Avenue to Wight Street, and thence, via Wight Street, McDougall Avenue and Guoin Street, connected to the old 8-inch main in Orleans Street, a 6-inch cross line being added on Adair Street, from Jefferson Avenue to the river. By the readjustment of the system the Bagg Street line was shut off at Grand River Avenue, and in order that the portion of the line west of this point, with the Fifteenth Street and Buchanan Street lines, might be used as a main artery for the lower service, the old 16-inch line in Miami Avenue and Park Street was extended from Washington Avenue up Park Street to Columbia Street, thence via Columbia, Cass, Gilman, Cherry and Sixth Streets, to connect with the Bagg Street line. This work was completed October 17, and finished the construction in connection with the readjustment of the system for this year.

As to the results obtained by these operations we may state broadly that so far as we know, since the first of September we have been able to supply to all of our consumers as great a quantity of water, and at as high a pressure, as they have demanded, and we are equally well satisfied that it is at least several years since this condition existed before. To consider the subject more specifically, attention is first invited to Plate I, on page 48, which shows the pressure record of the system for the last nine months of 1893. It is to be regretted that the records of the works do not furnish the data for extending the chart back further than the month of April, but, strange as it may seem, until that month there was no record kept of the head pumped against at the pumping station, and while the duty of the engines was figured on the basis of a head of 116 feet, it does not, in the light of the information embodied in Plates 1 and 2, seem possible that the mean pressure could ever have reached that point; for as shown on Plate 4, the quantity of water pumped the past year was greater than that pumped any preceding year except 1888, and the work done by the system as a whole has been decidedly greater than appears before while the average mean head at the engines has not exceeded 113 feet for any month. That such an immense gain in the efficiency of the system has been achieved, as can be proven if this old record is correct, is a claim that our regard for probability prevents us from maintaining.

The three lines at the top of Plate 1 represent the heads against which the engines worked, the full line being the mean head of the two systems. The lowest jagged line of the diagram shows the average pressure for each month on the distribution system as determined by readings on eleven gauges, taken hourly, as also were those at the pumping station, from which the upper lines were constructed. difference between this last line and the line of mean head at the engines represents the amount of work expended in attaining the elevations of the various points in our system and in overcoming the friction in the pipe. These quantities have been plotted for the several months and give the line near the middle of the diagram. This amount of pressure is lost so far as obtaining work from it is concerned. A part of it, that expended in overcoming the elevation, represented by the ordinates below the line at 40.4 feet, cannot be reduced or

changed; but that part due to friction, represented by the ordinates of the shaded area will change from various causes. For instance, the l frictional resistances increase with the velocity of flow, hence with the quantity of water pumped, and they also increase with the length of the pipe and the number and sharpness of bends. It appears from the diagram that the frictional loss in July was greater than it was in May or June because of the increased quantity of water pumped, but in August, though more water was pumped thanlin July, the frictional loss was less on account of the more economical adjustment of the system which was then being brought about, and the frictional loss has undergone a steady decrease since that time. September it was 13 per cent less than in July. though 3 per cent, more

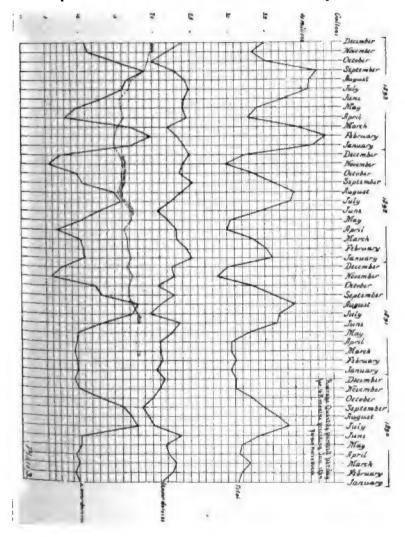

water was pumped. When it is remembered that any decrease in the loss of head means a corresponding decrease in the quantity of fuel consumed to maintain a given available pressure on the system, the importance of this subject will be appreciated. Comparing again the line of mean head at the pumping station with the line of average head on the system it will be seen that the latter has steadily increased since June, while the former has been decreasing since September. Here again comes in the item of cost, and it appears that we are giving our consumers 12 per cent. more pressure than we were able to give in July under the best arrangement we could devise and are pumping against a head only 92 per cent. as great.

We now leave the work of the engines as a separate factor and referring to Plate 2, page 49, we consider the system as a whole.

Beginning at the bottom of the diagram, we have first the fuel consumed each month since we have burned oil exclusively; second, the average pressures maintained on the system since July, 1891, the date of the establishment of the pressure gauges; third, the average number of gallons of water pumped per day; fourth, the available work of the system, i. a., the product of the gallons pumped per day multiplied by the pressure maintained on the system, which product is designated pound-gallons; and fifth, we have the available work done by one gallon of oil, also in pound-gallons.

It is at once seen that there was less fuel burned in September than in July, although there was more water pumped in September, and, owing to the increased pressure, vastly more work done. From September it will be seen that the fuel line divides. The upper branch representing the total fuel consumed, including that for heating buildings, etc., as well as pumping, while the lower branch represents the quantity used for pumping alone. Comparing now December, 1892, with December, 1893, we find that in December, 1892, 4,041 gallons of oil per day pumped 32,375,098 gallons of water, giving a pressure on the system of 15.69 pounds; and in December, 1893, making no correction for heating buildings, although the space

heated was fully 30 per cent. greater, we find that 4,733 gallons of oil pumped 35,026,431 gallons of water, giving a pressure of 19.95 pounds, or referring to the top line of the diagram, one gallon of oil did 125,703 pound-gallons of work in 1892, and 147,639 pound-gallons of work in 1893, showing a gain of over 17 per cent. which is a decrease in the cost of operation.

The upper line shows the fluctuations of the amount of work done by one gallon of oil since November, 1892, the lower branch being computed on the basis of the total fuel consumption and the upper one on the basis of the fuel actually used for pumping, and whichever line we choose to consider shows a marked improvement over the conditions of one year ago, or even of the first half of this year.

Turning now to Plate 3, which shows the quantity of water pumped in the upper and lower systems separately, and in the two combined by the upmost line, it is interesting to note that the total consumption has two maxima and two minima in the year. The first maximum is usually reached in January or February, and is due to the waste of water to prevent connections freezing; and the second occurs usually in August, and is due to the use of water on account of the hot weather. The minima occur about April and November, at which times there is the least demand for water on either of the above accounts. It is to be noted that the daily quantity of water allowed to run to waste in February of the past year exceeded that consumed in lawn sprinkling and other extraordinary uses during the hot months. In the dotted line of this diagram is again shown the variations of the average pressure since July, 1891, whence it appears that from a pressure since July, 1891, whence it appears that from a pressure since July, 1891, whence it appears that from a pressure since July, 1891, whence it appears that from a pressure since July, 1891, whence it appears that from a pressure since July, 1891, whence it appears that from a pressure since July, 1891, whence it appears that from a pressure since July, 1891, whence it appears that from a pressure since July, 1891, whence it appears that from a pressure since July, 1891, whence it appears that from a pressure since July, 1891, whence it appears that from a pressure since July, 1891, whence it appears that from a pressure since July, 1891, whence it appears that from a pressure since July, 1891, whence it appears that from a pressure since July, 1891, whence it appears that the pressure since July, 1891, whence it appears that the pressure since July, 1891, whence it appears the pressure since July, 1891, whence it appears the pressure since July, 1891, whence J ure of 18 pounds at that date, it continued generally to decrease until it reached its minimum in January and February, 1893, notwithstanding the efforts being put forth to recover it. In March, under the effects of a decreasing consumption, it began to recover slightly, and in April reached a temporary maximum, on account of the small quantity pumped and the partial readjustment of the old system. It fell with the increased pumping in May and June until the temporary arrangement before described was effected in July, since which time it has been steadily increasing, and this with the same engine and boilers at the pumping station which were, under former conditions, reported worked far beyond their capacity in 1891.

The average pressure on our system in December was, according to the eleven permanent gauges, 19.95 pounds. The

record of pressures from 97 hydrants on single readings, taken in November and December, shows the average of the system to be 24.16 pounds as compared with an average of 18.87 pounds for the same hydrants in March, and the average of 173 hydrants taken in November and December, and recorded in the column headed "December, 1893," on page 61, gives an average pressure of 24.41 pounds for the system, which is probably a very close approximation to the conditions. The greatest proportional gain noted in any one locality was at the corner of Kirby and Trumbull avenues, where the pressure had increased from 10 pounds in March to $19\frac{1}{2}$ pounds in December, a gain of 95 per cent.

In the adjustments of the pressures and the distribution of the supply, we have endeavored to maintain the proposition that every citizen of Detroit is entitled to as much water at our hands as he is willing to pay for, and that he is entitled to it at the same pressure as his neighbor. While the contour of the ground will prevent the full realization of the latter part of the proposition, it may reasonably be expected that henceforth we will be able to supply fixtures on the third floor of any building within the city limits.

In Plate 4 we show the number of families supplied, the quantity of water consumed and the amount of pipe in service for each year from 1853 to 1893, inclusive. This information is interesting, as showing that while the first and the last items have maintained about the same relation to each other for forty years, the water consumption has increased much more rapidly than either. In the compilation of this data, the actual number of families supplied—counting each hotel as one family—is taken, excluding all mercantile and manufacturing establishments, it being satisfactorily proven that the consumption in such lines does not affect the family consumption, for if one such establishment is a necessary adjunct of a population of one hundred families, a similar establishment will be a necessary adjunct of every other one hundred families. This is not a theory, but was proven by your Secretary in his annual report for 1892.

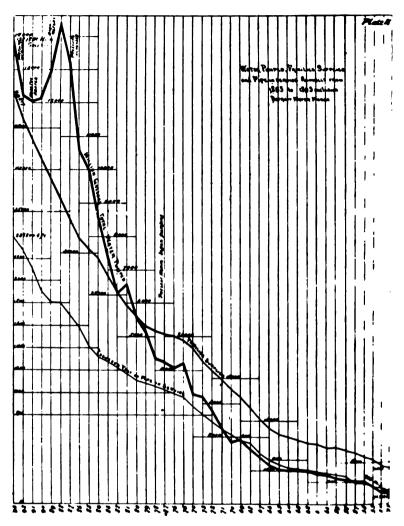

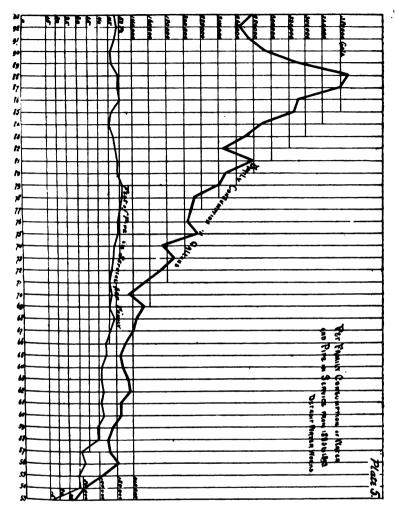

Plate 5 shows more clearly the annual increase of consumption per family, and also the feet of pipe in service per family, which latter has not varied ten feet since 1860, and having its maximum of 51 feet in 1878, has for 1893 fallen to 48 feet, thus showing that our distribution is becoming more concentrated.

We now come to the consideration of another very impor-

tant subject, that of Waste. The total average waste of water in our system, from the best information obtained as yet, appears to be about 60 per cent. of the entire quantity pumped. This, in this system as in any other, can be considered in two parts, which must be treated separately in any plan for its curtailment. The first portion to be dealt with, and the one most frequently receiving attention, is that due to the careless-

ness of man in handling the fixtures on his own premises; while the second comprises that due to defective construction. former may be restricted in various ways, and its amount will vary greatly from time to time, but other things being the same, will increase with the population. The most satisfactory method of dealing with this part of the problem, is undoubtedly the meter system, and our consumers are many of them to be congratulated for not being required to pay the cost of what other persons use. The second part of the problem does not admit of so easy a solution. The waste due to defective construction will be changed only by variations of pressure and an increase or decrease of such construction. see that in our system there are about 430 miles of pipe that has never been tested in the sight of man, and that this means about 200,000 joints of all sizes, which, if reduced to equivalent four-inch joints, would be 411,000 that may be leaking for all any person knows, we must appreciate the probability of a very large part of our leakage being found here. During the past season, under the writer's immediate supervision, there have been taken up or uncovered in our system about three miles of pipe and in this the proportion of leaking joints was about 60 per cent. of the whole number nncovered. Everywhere was found evidence of the most careless work. joints appeared never to have been driven at all, and in others only the top was tooled. The latter was the case with a joint uncovered in a 42-inch main which must have been leaking for sixteen years, and had finally caused a settlement of the street car track for a space fully fifty feet in length. As there has not yet been devised any means of telling whether a joint is tight except to try it, it was recommended to require all joints to be tested in the open ditch under as high a pressure as may be available, and to be carefully inspected under pressure after they have been tested for some hours. This recommendation was approved by your Honorable Body, and has been strictly adhered to on that part of the work under the writer's charge. but it seems to have been treated with considerable indifference in other extensions. The remedy of defects in the old

work will require so large an expenditure that it does not seem likely ever to be considered except in specific cases where the leak is known positively to exist.

Another source of immense loss is the old-fashioned corporation cocks which were driven with a hammer into a hole drilled in the pipe with an ordinary ratchet and drill. The weight of the earth piled above, usually was sufficient to so loosen the cocks as to cause a continuous flow from them. This system of tapping became obsolete in most cities twenty years ago, and was superseded by the tapping machine which drills and threads a hole and screws a cock into it, making a perfectly tight connection without wasting more than a pint of water, although worked against a pressure of 160 pounds. The latter method was recommended to your Honorable Body and adopted in May last, and has since been in very satisfactory operation.

From the number of broken gates reported in our system and the leakage around the gate stems, it was considered advisable to construct around all gates in paved streets permanent wells of sufficient size to admit a man, so as to afford easy access in making necessary repairs. The advantages of this plan have had abundant proof even in the very short time it has been in vogue. During the year there have been constructed 639 such wells at a total cost of \$14,399.95, of which 480 were in old work and cost \$10,990.07, and 159 were in connection with new lines and cost \$3,409.88.

In addition to the previously described construction, a line of 10-inch pipe has been laid under the writer's supervision across the channel to supply Belle Isle Park. While this work has not yet been completed, the pipe has been successfully laid in place by the contractor.

On April 19 last, a fire broke out at the Kling Brewery, situated near the corner of Jefferson and Field Avenues, which developed one of the most serious minor defects of our system. It appears to have been the practice heretofore to lay large and small supply mains through districts they were intended to supply without connecting them to the cross lines.

From this defect a very serious loss was only averted by the good judgment of one of the Fire Department officials, who stationed two of the engines to take water from the river. while the other three actually pumped dry that portion of the city between Jefferson and Mack Avenues east of the Belt Line Railroad. An investigation revealed that there was in Jefferson Avenue a 6-inch main laid parallel with the 42-inch, but only connected to it at points 5,100 feet apart, and that the district north was supplied entirely from this 6-inch main, and all hydrants were connected with it. Your Honorable Body at once adopted the recommendation that cross-connections be put in at intermediate points, which work has been successfully accomplished without shutting off the water in the 42-inch main, and without any special machinery, by a contrivance of the writer's, the saving per connection over the Smith sleeve being about \$175 for 6-inch, and \$200 for 10inch connections. That similar conditions exist elsewhere in our system is demonstrated by the records recently compiled in the draughting room, which, in maps showing 1,131 intersecting lines, reveal that 172, or over 15 per cent. of them, are not connected, and sixteen connections of old lines have been made this season.

The cost and extent of the various construction under your Civil Engineer's supervision has been as follows:

Michigan Avenue Line—		
9,414 feet 24-in. pipe and 84 feet 16-in. pipe	\$44,888	*
Meldrum, Wight, McDougall, Guoin and Adair St. Line—7,870 feet 10-in. pipe and 1,248 feet 6-in. pipe	19,096	\$
Park Street Line— 4,496 feet 16-in. pipe and 1,650 feet 12-in. pipe	20,878	17
Jefferson Avenue Cross-Connections— 2 10-in. and 8 6-in. connections	1 898	30
Belle Isle River Crossing— 8,550 feet 10-in. pipe to date	9,663	23
Work at Pumping Station, remodeling coal sheds and clearing canal bank		54
Making a total of	000 158	22

The only line likely to come under the head of extraordinary construction during the ensuing year is the one already endorsed by your Honorable Body, to be laid across town at about the locality of Farnsworth Street, the estimates for which are \$55,000. The matter of a sufficient and effective means of removing from our system the accumulations of the past forty years is at present also under consideration. To correct an erroneous impression often voiced in the daily press regarding the efficacy of a settling basin in reducing the sediment in our water, it may be stated that in the periods of maximum demand the settling basin is emptied about twice every twenty-four hours, and about one and a half times in the periods of minimum consumption.

In August last the draughting room and records of the Iron Pipe Department were placed under the control of the Civil Engineer. Previous to that time the records of the department comprised an outline map of the entire city to a scale of 300 feet to the inch and memorandum records of pipe laid, journalized without drawings. Under the instructions of your Honorable Body the services of Mr. Clarence W. Hubbell were engaged as chief draughtsman, who assumed those duties September first and from whose report the following is abstracted:

The force in the draughting room has consisted, since September 1, of the Chief Draughtsman and two assistants with the services of a third a part of the time. One complete set of small scale city maps have been kept corrected up to date, and the compilation and preparation of a complete and intelligent record of the pipeage system has been commenced. For the latter it is contemplated to made a plat of each street and alley intersection, showing the location of all specials, gates, pipe and any other information of value. These plats are about 20x21 inches in size and are drawn to a scale of eight feet to the inch. When completed there will be about 8,000 tracings arranged in north and south streets, and 8,000 blue prints of the same arranged in east and west streets. On September 1, there were on hand 128 tracings and about 900

pencil drawings of intersections. All of the former have been corrected to date and two hundred of the latter have been traced and corrected, so that with new work we now have 788 new tracings, 128 old tracings, 205 new pencil drawings and 700 old pencil drawings, a total of 1,821 street and alley intersections. Excluding the 700 old pencil drawings not yet corrected, we have 1,121 plats brought up to date, covering 1,131 intersecting lines. In making this record every available source of information has been utilized, and while a perfect record is not possible under the circumstances, there being no serviceable record earlier than 1877 other than the annual report, it is expected that one as near the ideal as possible, and in convenient form for reference, will ultimately be obtained.

In closing this report it gives me more than ordinary pleasure to speak of the many very valuable suggestions and the hearty co-operation received at the hands of the Chief Engineer and his assistants at the pumping station, and much of the advantage of the present system of operation as deduced in this report is to be credited to the very skillful management of that part of the plant. The debt that is owed by our citizens to your Secretary must not be passed over without remark. That a man without special engineering training should have come to a conception, and so near to a correction of the evils of this system, where men of professed training in engineering lines had failed, is a matter of surprise and a cause for congratulation. Without the efforts which he put forth, the condition of a part of our city must have been serious indeed during the latter part of 1892.

This report is, gentlemen, very respectfully submitted.

REPORT OF SUPERINTENDENT OF METERS AND INSPECTION.

DETROIT, January 2, 1894.

To the Board of Water Commissioners:

GENTLEMEN—In compliance with the rules of your honorable body, I herewith report the work done in the Meter, Inspection and Service Cocks Departments during the year 1893.

The following tables show the number of meters placed, the number removed, and the total number in service on the 31st day of December, 1893:

Placed in 1893.

In presenting this report to your honorable body, I ampleased to say that the affairs in the Meter Department have moved along during the past year very satisfactorily, and without any material change from former years. We have placed 526 meters, making the total number now in use, 2,579.

Nothing has transpired that tends to shake our faith in the wisdom shown in adopting the meter system four years ago.

There has been a great change in the minds of water takers since the meter system was first adopted. At that time almost every person was afraid that their rates would be increased

by the use of a meter, so much so, that some of them, on the first indication that we contemplated placing a meter on their premises, would rush to the office and pay six months' or a year's rates in advance at the estimated assessment, rather than take the chance of paying by meter rates. One party, who had been paying \$60 per year on his factory, when he saw us preparing to meter his premises, hurried to the office and paid six months' rates, \$30, in advance, and went away gloating over the idea of his shrewdness. Nevertheless we placed the meter, and at the end of six months found that he had used just \$12 worth of water, for which he had paid \$30, but he considered it such a good joke on himself that he never applied for a rebate. Such instances go to prove that the meter is much more accurate than an estimator in arriving at the quantity of water consumed. But, as I said before, the minds of water takers have changed in a great degree, as the larger proportion of meters placed now are on the premises of those who apply for them, as they prefer paying by meter rather than the estimated rate (one hundred and fifty of such applications having been received during the past six months). There are some who object to the paying of their meter rates monthly, especially the small consumers, claiming that they ought not to be obliged to come to the office every month to pay the small sum of seventyfive cents, that being the minimum rate, and an amount which a considerable number pay. It is possible that it would be advisable to make a rule allowing all bills below a fixed amount to be paid quarterly, and above that amount monthly. In any event it would be necessary to read the meters each month as a matter of protection to the consumer as well as that of the meter, inasmuch as leaks are continually occurring which increase the consumption unnecessarily, and sometimes to a large amount, and by a monthly reading consumers are made aware of the fact, and can make the necessary repairs, so that the next month's consumption will only amount to the legitimate uses, whereas, if meters were allowed to go three months without reading, it would often make the consumer pay for a large quantity, of which the greater portion would be waste.

with monthly readings, all consumers should learn to read their meters, and by so doing would detect leaks whenever they occur, as an undue consumption would immediately lead to an investigation. If all large consumers would read their meters each day, it would insure them against paying any large amount for waste, something that has occurred at different times in the past. In some cases forty or fifty dollars have been paid in one month for waste alone, when, if the register of the meter had been taken each day, nearly the whole amount could have been saved to the consumer.

The cost of repairing meters has increased during the past year, owing to the increased number in use, and also to the fact of the last winter being a very severe one. We had quite a large number frozen, but were able to repair very nearly all of them, the cost of which was principally for labor only, as the material required was trifling. We have thirty of the smaller sizes, mostly &-inch, which we are unable to repair. They are an accumulation of four years, and to send them to the factory for repairs would cost more than we are now paying for new meters, which, if frozen, we can repair ourselves, without any more cost than that of labor, a fact that has saved us in the past, and will continue to save in the future, a large amount in repairs. Meters are supposed to be placed where there is no danger of frost, but after all of our precautions they do not all escape, because the frost often catches the service pipe, several feet from the meter, and will follow along the pipe until it eventually reaches it. Sometimes they are frozen through the carelessness of the occupant, who leaves the cellar window or door open, and exposes the meter, but where it is clearly the fault of the occupant, our rules now provide that he shall pay the cost of repairs. Of the 2,579 meters in service, 712 of them are in pits outside of the buildings, and protected with iron covers, none of which have ever been frozen.

In compliance with a resolution of your honorable body requiring meters to be placed on some of the public school buildings, police stations, and fire engine houses as a matter of information to know about the quantity of water that is being

furnished to said institutions, I have had meters placed on three school buildings, two police stations and two engine houses with the following results:

The Cass School in four months consumed 936,100 cubic feet, equal to 7,020,750 gallons and the average attendance being 942 makes an average daily consumption of 62 gallons per capita, or in other words about two barrels per day for each attendant. The Bishop School with an average attendance of 1.015 consumed in the same length of time 435,200 cubic feet, or 3,264,000 gallons, being an average daily consumption of 27 gallons per capita, or not quite half as much as the Cass School, while the Barstow School with an average attendance of 465 consumed 18,400 cubic feet, or 138,000 gallons, being an average of $2\frac{1}{2}$ gallons per capita daily. latter building is provided with the "dry closets" which, I presume accounts for the small consumption in comparison with the others. The enormous consumption at the Cass shows that we were correct in claiming that a very large and needless waste is continually going on in some, if not all, of the school buildings. Taking the three buildings as an average and we have a consumption of between two and three hundred million gallons per year, and at one-third of a cent per 100 gallons would amount to over \$7,000, while we are collecting from the Board of Education for water used in public schools \$1,971. I have no doubt but the amount paid is ample for all legitimate uses, and I also think that when the proper authorities are shown the large waste that is going on in the schools throughout the city, that they will take the necessary means to largely reduce it.

The Central Police Station consumed 100,400 cubic feet in four months or at the rate of 301,200 cubic feet per year, which at one-third of a cent. per 100 gallons would amount to \$70.30, while their estimated assessment on the premises, and which they pay, is \$70.00, showing the estimated and meter rate almost precisely the same. At the Woodbridge Street Station there was 24,900 cubic feet consumed in the same length of time, or at the rate of 74,700 cubic feet per year,

and at the same rate per gallon would amount to \$18.67, while they are paying a rate of \$16.00 per year, showing also a very close comparison between meter and estimated rates. It is fair to presume that the eight remaining stations are paying about the same ratio of rates, which would prove very conclusively that there is not much waste taking place in that department, for which the officials in charge are entitled to credit.

The consumption of water in the engine houses (on which there is no assessment) is not large and shows that there is very little waste in that direction. Engine House No 10 consumed 3,000 cubic feet in 40 days, and Engine House No. 11 consumed 5,500 cubic feet in the same length of time. If the foregoing is a fair average there would be consumed in the twenty-eight engine and truck houses something over 1,000,000 cubic feet per year, not a very exorbitant amount considering the number of persons employed therein, and also the horses, carriages, etc., that are cared for. It would show a very careful surveillance over the water fixtures throughout the buildings of the fire department, if the foregoing is a fair average, which I have no reason to doubt that it is.

INSPECTION.

No change in the working of this department has been made during the past year with the exception of the addition of one more examiner, making five in all. It is impossible for four men to get over the city twice each year, as so much of their time is taken up—about one-third—in reading meters and delivering meter bills, and as two examinations each year is absolutely necessary, I was obliged to ask for another examiner. With all the diligence shown, however, the percentage of leaks is increasing each year. In 1891 the percentage of leaks to number of examinations made was 4.77, in 1892, 6.63, and in 1893, 7.77. There is very little attention paid to the repairing of leaks by the majority of water takers until they are compelled to do so by a threat to shut off the water. In some instances leaks are going on without the knowledge of the occupant, who is first made aware of it by a notice from

the examiner, but whether they know it or not it makes very little difference, for the repairs are seldom made until they get a peremptory notice to do so. This of course refers to unmetered connections, as there is no trouble to get repairs made on connections that are metered, unless it be that portion of the service pipe between the street main and the meter, for at that point the direct cost to the consumer is nothing, while it puts it upon the city at large, a fact that would lead to an indiscriminate and endless waste, were the individual consumers not held responsible for the water used on their premises. increased pressure throughout the city during the past three years has undoubtedly had a great deal to do with the increased number of leaks, more particularly during the last season as the pressure has been increased very materially in a large portion of the city, the average being about five pounds. Previous to the year 1891 our rules allowed the use of lead service pipe known as "medium," which answered all purposes while the pressure remained as it did when the rule was adopted, but, as the leaks increased, we found it due in many cases to the lightness of the service pipe, and on January 1st, 1891, the Board adopted a rule allowing nothing lighter than pipe designated as "strong" which will undoubtedly be the means of preventing many leaks in the future; but I anticipate numerous leaks and large waste while there remains so much "light"-as there seems to have been a time when any kind was allowed—and "medium" pipe throughout the city.

Another source of waste we have had to contend with during the past season was caused by many who allowed the water to run continually, claiming that they were ordered to do so by the Health Officer, and while there is no doubt many of them received such orders, many more made the same claim who had received no such notice, but in all cases our examiners notified them that no such permission had been granted by the Board of Water Commissioners, and until they were given such permission it could not be allowed, and as the necessity or advisability of such orders from the health officers was of a doubtful nature, the consumers, as far as we were able to judge,

willingly complied with our notice to discontinue the practice.

The examiners made 55,086 examinations, reported 4,271 leaks, 3,984 of which were repaired on due notice being given, and 287 were ordered to be shut off for failure to make necessary repairs.

SERVICE CONNECTIONS.

On the first of last July, the Service Connections was transferred by the Secretary from the Iron Pipe to my department, and about the same time the mode of making such connections was changed also.

It has been evident for some time past that with the increased pressure added to our mains throughout the city, the time had come for the changing of the "drive cock" system to a more secure way of inserting them. They have been a source of a great deal of trouble on account of their liability to be blown out or become loose, causing numerous leaks and large waste, and thereby adding largely to the expense of the department of repairing leaks.

After consulting Secretary Case and myself, Civil Engineer Williams recommended to your honorable body the purchasing of three "Muchler Tapping Machines," the machines to cost \$85 each, and with the necessary appliances—such as saddles, etc.—for operating the same, an additional cost of \$25; making the total cost \$280, to commence operation under the new system. As your honorable body complied with the recommendation, the machines were purchased and have been in operation since that time.

These machines drill the hole and insert the cock with a screw under pressure without the escape of any water whatever. Under the former system the tapper drilled the hole nearly through the pipe, then inserted the cock, and by giving it a sudden blow with the hammer would drive it into place, a small portion of the pipe breaking away and dropping inside. If by any chance, through a defect in pipe or otherwise, the cock did not fit properly, it would often blow out and deluge the

tapper with water, besides causing much trouble, sometimes making it necessary to shut off the line before the connection could be made, something that cannot occur with the Muehler machine.

The cost of operating it is about the same as the old way, but there is a difference in the cost of the Muehler over the drive cock of 14 4-10 per cent, making the increased cost on total number inserted (1,900) up to January 1st, 1894, \$151.24; a trifling amount when compared with the saving it will surely bring about in the future.

The Smith machine, purchased by the Board at a cost of \$850, in the latter part of 1892, for making 2-in., 3-in., 4-in., and 6-in. connections under pressure, has proven itself to be all that the inventor claimed for it. It is a wonderful improvement over the old way of making such connections, and also saves a large amount of labor.

With this machine it is not necessary to shut off the street main when making a connection. The sleeve, with valve attached, is simply leaded around the pipe, the valve opened, when the drill passes through the valve, cuts a core from the pipe of the required size, withdraws said core back of the valve, which is then closed, when the core is removed and the connection is completed.

Formerly, in making a connection larger than 1 inch, the line of pipe on which such connection was made had to be shut off, and before doing so, each consumer on the line received a personal notice to that effect. That being done, the work of shutting off began, and it was necessary to shut all the way from two to ten gates—at one time seventeen—before the water was entirely shut off; then the hole was cut in the pipe. After that the water had to be removed, as usually the larger portion of the water in the district shut off had to be removed from the ditch before the joints could be leaded. And as it often happened a perfect shut-off could not be obtained—through defective gates—the labor of removing the water was increased, and the condition of the men when through was often deplorable. Then again, nearly all such connections had to be

made in the night, thereby adding largely to the expense, as the district deprived of water usually included factories or some one who could not get along without water while the connection was being made, therefore making it necessary to do it after business hours, and often after 12 o'clock at night, as we never compelled factories to shut down or deprived large hotels, etc., of water until after that time, unless it was absolutely necessary. And again, in closing gates there is always a possibility of breaking them, something that has often occurred, and which has been very expensive, also. But all such difficulties and annoyances have been done away with by the use of the Smith machine. It has saved the Water Works much money, and also the tappers from many a cold bath during the time it has been in operation.

The total expense of the Service Cocks Department, including labor, material and inspection, amounts to \$10,278.83. Of that amount, \$3,912.50 should be deducted, as it represents the labor of the inspectors of new work, whose duties are principally confined to the inspection of plumbing and keeping the records of work done in that line throughout the city. The report of their work in detail is shown in a table following this statement of the service cocks proper, viz.:

Receipts for service cocks	\$6,615	65		
Receipts for plumbers' licenses	635	00		
Total expense Service Cocks Department	\$10,278	88	\$7,850	65
Less labor of inspectors	8,912	5 0	\$6,866	33
Balance to the credit of service cocks			\$884	33

The following table shows the duties performed by the inspectors of new work during the year 1893:

INSPECTION OF NEW WORK

,	Wards.	Calls for Non-payment.	Shut for Non-payment.	Examined New Connections.	Examined Exten's and Fixtures.	Let on New Connections.	Notified for Building Tax.	Shut for Vacancy.
Michael Hart	8, 10 and 12	1,950	496	403	891	800	20	, 8 0
John Hatzenbuhler	7, 9 and 11	2,019	152	876	39 0	237	25	20
John Becker	2, 4 and 6	2,145	239	826	250	248	78	90
Adolph Jasnowski	14 and 16	1,908	209	472	825	169	33	19
C. J. Skinner	1, 8 and 5	2,428	109	265	840	307	114	187
Robert Pelham, Jr	18 and 15	2,024	220	578	810	808	88	72
TOTAL		12,464	1,425	2,415	2,006	1,569	808	418

In addition to the above work, the inspectors have devoted considerable time in examining and locating stop boxes, and ordering them exposed to sight, repaired or replaced with new ones as the case required. It necessitates the utmost vigilance to keep the stop-boxes exposed to view. Sidewalks being repaired, new ones built, or change of grade in street, alley or lot, the tendency is to pay little attention to the stop-box, and it is usually covered up, as the majority of water takers can see very little use for it until there is an urgent request for shutting off the water in case of bursted pipes, etc., when they have a forcible reminder of its necessity. Not only that, but during the last year there have been 12,464 places reported to be shut off for non-payment, besides many places for vacancy, showing the need of keeping the stop-boxes in sight at all times. A duty that will always exist will be that of seeing they are kept in proper condition, and as there are thousands of them, and increasing daily, one can readily see that it will require much time and watchfulness on the part of the inspectors in giving them the necessary attention.

made in the night, thereby adding largely to the expense, as the district deprived of water usually included factories or some one who could not get along without water while the connection was being made, therefore making it necessary to do it after business hours, and often after 12 o'clock at night, as we never compelled factories to shut down or deprived large hotels, etc.. of water until after that time, unless it was absolutely necessary. Attached to this report are complete lists of tools on hand and an itemized account of material in stock in the Meter and Service Cocks Departments, on the 31st day of December, 1893.

In concluding this report, will say that I have endeavored to conduct the work in the departments over which I have charge, with as much economy as possible, and the employés under my supervision have shown a faithfulness in their work that leads me to believe that the Water Works has received full value for the money expended during the past year.

The uniform kindness shown me and the able assistance given by the Secretary, is appreciated to the fullest extent, and for the kind and considerate treatment of your honorable body throughout the past, I beg to offer my warmest thanks.

All of which is respectfully submitted.

T. R. PUTNAM, Superintendent Meters and Inspection

REPORT OF CHIEF ENGINEER AT PUMPING WORKS.

DETROIT, January 1, 1894.

To the Board of Water Commissioners:

GENTLEMEN — I have the honor to submit the Engineer's report for the year 1893.

The following table shows the number of gallons of water pumped, and cost of fuel for the years named:

235,840,271 303,551,749 375,455,126 542,807,863 692,194,395 697,100,523 715,061,307 582,112,587	\$2,129 37 2,271 34 3,325 81 4,017 44	646,411 931,594 1,030,8:6

Cost per million gallons, \$3.35. Engines No. 1 and 2 were run part of the year with one pump detached.

The tables show that the water pumped during the year is 13,877,977,208 gallons. The total expense for pumping water is \$46,546.01, making cost per million gallons, \$3.35. Our average pressure during the year has been higher than ever before, and the cry of short supply is very seldom heard.

The engines and boilers have had only minor repairs during the year, but the boilers will need some repairs soon; otherwise we are now in fair condition.

It is often necessary to reduce the capacity of the three engines now in operation, at such seasons of the year when the demand is at the minimum. This can only be done by stopping the engines, pumping out the well and disconnecting one of the pumps, at a loss of considerable time and expense, besides leaving the engine in a crippled condition. As a matter of safety and economy, I would recommend putting in a connection between the pumps, with valves so arranged that the engines could be changed from one-half to full capacity without stopping.

We have had nearly two years' experience with crude oil for fuel. It is very convenient, and also economical, as the following facts show: Our daily average for 1893 is 38,021,855 gallons, which nearly equals the daily average for 1888, when the cost for coal was \$39,568.66, whereas this year the cost for oil is \$27,479.93, making a saving of \$12,088.73, which we think is remarkable, considering the fact that we have pumped against a pressure of 125 feet during the warm days of summer, whereas we formerly pumped against only 116 feet. We expect to make a still further reduction the coming year, when our new triple expansion engine is ready for use, which we expect will be the latter part of January. This will add twenty-four million gallons to our maximum daily capacity, which will then be one hundred and two millions.

This engine is considered the most economical pumping engine made, and may be described as follows: triple expansion high steam cylinder 28 in., intermediate 48 in., 74 in. in diameter, with a stroke of sixty inches. The steam cylinders are steam jacketed and covered with non-conducting material, with black walnut in narrow strips fastened on with nickle-plated bands and screws. The cylinders are fitted with the Reynolds-Corliss valve gear, especially arranged for this type of engine, having independent adjustable cut-offs for each cylinder. There are three pumps located beneath and directly in line with the cylinders. The pump plungers are rigidly connected to the steam piston by means of four steel distance rods, passing directly from the cross-heads to the pump plungers. The pumps are of the single-acting, outside-packed plunger type, each pump having one plunger 36 in. in diameter, 60-in. stroke. The suction pipe is 48 in. and discharge 42 in. in diameter. The condenser is of the jet type. The main shaft 18 in, diameter, journal 18 in, and 24 in, long. There are three cranks, set at angles of 120 degrees apart; two fly wheels, 20 feet in diameter, weighing 25 tons each. Steam will be supplied by four horizontal tubular boilers, 62 in. diameter, 20 feet long, each boiler containing forty-nine 4-in. tubes. The boilers are constructed of the best flange steel, 60,000 pounds tensile

strength, thoroughly braced and stayed to carry a working pressure of 125 pounds per square inch. The boiler fronts are of cast iron. The engine is nearly completed, and I am satisfied will prove a great saving in fuel, and also give us the benefit of higher pressure when needed.

It is very frequently necessary to raise the pressure higher than our stand-pipe, and, as the stand-pipe does not relieve the engines, I would recommend connecting the 30-inch main thereto, through a weighted relief valve, direct to the waste, and discontinue the use of the stand-pipe altogether.

The buildings have recently been painted and striped, greatly improving their appearance. Removing the old wooden shed and using part of our coal shed for a blacksmith shop, horse stable and store room, is a decided improvement.

For fire protection and washing out wells, I would recommend extending the 4-inch water-pipe to the south end of the shed and setting a fire hydrant.

You will notice the duty has fallen off during the cold weather, which may be accounted for by the additional space heated by steam.

Inlet pipe number two has been out of use for some time, being reported in a leaky condition by submarine diver Dwyer. As it is necessary to use three inlets at times, I would recommend having this pipe relaid the coming season.

Respectfully submitted.

URIAH GOULD,

Engineer.

REPORT OF THE SUPERINTENDENT OF GROUNDS.

To the Honorable the Board of Water Commissioners:

GENTLEMEN—In submitting my report for the year 1893, I wish to say, first, that the Park is rapidly growing in popularity. Visitors, the past season, far outnumber those of former years, and many expressed themselves as delighted with the arrangement of flower beds and the general care of the Park. The greenhouse built in the fall of 1892 has been of great value, enabling us to make a floral display equal to any in the city. When the different improvements begun this season are completed, which we hope will not be later than June 15th, the Hurlbut Park will be one of the most attractive in the city.

The Hurlbut Memorial Gate, with a frontage of one hundred and thirty-two feet, and fifty feet high, is certainly one of the finest structures of stone and iron to be found in this country.

The iron fence along the front, extending back one hundred feet on the east and west lines, adds very much to the appearance of the grounds.

The waterway, or canal, now being cut from the river through what has been heretofore low marsh, so as to leave two small islands, practically reclaims this whole section of the grounds, and, instead of rank growth of flags and stagnant water, we will have a beautiful winding canal, where row-boats may come well up into the Park. When this part of the grounds is properly graded and trees, shrubs and flowers planted, it will be one of the pleasantest parts of the Park.

Removing the unsightly old coal tramway and dock, and sloping the canal bank to the water's edge, changes very much the appearance of this part of the grounds. What has hereto-

fore been a storage place for old pipes, lumber, iron, etc., will be beautiful lawn, walks, trees, shrubs and flowers.

The new addition to our greenhouse will double the former capacity, and give us an opportunity to increase our floral display in keeping with other improvements.

There is now needed a suitable toilet room for ladies, and also a shelter for horses and carriages. Part of the space between the coal sheds could be covered with corrugated iron roof, supported on iron posts, and would make such shelter with very little expense.

The inventory of tools and implements in this department accompany this report.

Very respectfully,

E. A. SCRIBNER, Superintendent of Grounds.

REPORT OF THE SUPERINTENDENT OF EXTENSIONS.

DETROIT, January 2d, 1894.

To the Board of Water Commissioners:

GENTLEMEN—In accordance with the regulations of your Honorable Body, I have the honor of presenting my annual report, relative to the general condition and progress of the work in this department.

During the year just closed, not less than thirty-two miles of extensions have been made to our pipeage.

It had been, I believe, the desire of your Honorable Body, to make the general expenses of the Works for the year just closed, as light as possible. It would, however, seem from the above mentioned mileage laid, that so far as this department was concerned, it had failed.

It is somewhat difficult to approximate very closely the probable outlay of this branch of the work at the commencement of the year, it being largely governed by the number of calls during the year for extensions.

The calls for extensions for the past season have been more numerous than the times would seem to demand. Should the coming season be one of increased activity, I anticipate no very great abatement to this branch of the work, and from the large amount of unoccupied land in the recently annexed territory, we may expect to receive numerous calls for extensions. The work in this department has compassed nearly 500 points or lines of extensions, the chief of which have been the extension of the Abbott street line of 24-inch main; this was extended on Tenth street to Michigan avenue, and from this point to Vinewood avenue, connecting with the 24-inch main in said avenue. The 16-inch main in Park street was also extended in said street to Columbia street, and in this street

westward to Cass, thence north on Cass to Gilman street, and on Gilman and Cherry streets to Seventh street; from this line a 12-inch main was laid in Sixth street to Bagg street, connecting with the 24-inch in Bagg street.

A line of 10-inch main was laid in the more easterly portion of the city, this line was laid in Meldrum avenue, connecting with the 42-inch main in Jefferson avenue, thence running south to Wight street, and from this point westward to McDougall avenue, thence south to Guoin street, and in this street westward again to Orleans street, connecting with the 10-inch main at this point.

In addition to the foregoing, a few of the lines recommended in last year's annual report by the Fire Department and myself, have in part been complied with. These are as follows: A 10-inch main in State street from the 30-inch in Washington avenue and State street to Cass street, connecting with the 10-inch in Cass street. An 8-inch main in Monroe avenue from Randolph to St. Antoine streets, connecting with all the lines crossing the same. Also an 8-inch main in Elizabeth street, from Cass to Grand River avenues, connecting with the Cass and Grand River avenue mains. section of 8-inch was also laid in Forest avenue, from Trumbull to Avery avenues. An 8-inch main was laid in Wabash avenue from the 30-inch in Buchanan street to Lake Shore R. R. A short section of 10-inch was laid in Hamilton Boulevard. from Hazlewood to Bancroft avenues. A section of the proposed 10-inch in St. Aubin avenue was also laid from the 24-inch main in the N. Boulevard to Trombly avenue, and from which a line of 8-inch pipe was laid in Trombly avenue to Russell street. A short section of 8-inch pipe was laid in Oakland avenue from Englewood avenue north to the city limits. A few lines of 6-inch pipe were laid in the following places: Hastings street from the N. Boulevard to Trombly avenue; Piquette avenue from Beaubien to Russell streets; and Adair street from Jefferson avenue to south of Wight street.

In addition to the above, quite a number of special lines of 6 inch were laid.

RECOMMENDATIONS.

I would respectfully recommend that the following lines may be laid for a more general supply and for better fire protection.

Appended are a few locations which I believe are worthy of your prayerful consideration, and which have been greatly overlooked in the anxiety to care for the more business portions of the city. The following are a few of this order:

Second street; from Fort to alley south of Abbott street, distance 900 feet.

Third street; from Fort to Abbott streets, distance about 1.030 feet.

Fifth street; from alley south of Howard to Labrosse streets, distance about 1,125 feet.

Sixth street; from Abbott to alley north of Labrosse street, distance about 825 feet.

Eighth street; from Fort to Baker streets, distance about 2,025 feet.

Trumbull avenue; from Fort to alley south of Abbott street and from Abbott street to Michigan avenue, distance about 2,500 feet.

There are now no water mains within the above-mentioned distances, the supply of water is through the alleys, most of which are 4 inches in diameter. Each of the above-mentioned lines would have a direct connection with the 24-inch main in Abbott street, and a few with the 16-inch main in Fort street.

I again mention the following lines, which appeared in last annual report of recommendations:

Twelfth street, from Howard to Baker streets. This street is densely built up with residence property, and at Howard street are several large manufactories. A larger main should be laid than the one now in use; the present one is only 4 inches. It would greatly improve this section if a line of pipe should be extended along Abbott street from the 24-inch main at Abbott and Tenth streets to Twelfth.

I am still of the opinion that the laying of a 12-inch pipe in Commonwealth avenue from the 30-inch main in Brigham

street to Kirby avenue, is a wise thing to do, as recommended a year ago, and from which the laying of an 8- or 10-inch in Kirby avenue from Grand River to Woodward avenues. This arrangement would make a splendid cross-feed to the intersecting lines, and should it be needed to lay for better fire protection in the immediate streets crossing Commonwealth avenue, this would be an excellent feeder in this locality. The line in Commonwealth avenue is about 3,200 feet, and the one in Kirby avenue would be about 8,500 feet. A similar line to this would be well to consider for the east side, extending to and connecting with the 30-inch main in Collins street.

I would again mention Park street. There is but a 4-inch pipe in this street from Henry to Peterboro, and also in the intervening streets crossing Park street; this street is densely built up and should have better fire protection. This line would have a direct connection with the 24-inch in Bagg street and the 16-inch main at Park and Columbia streets.

John R. street, from Piquette avenue to N. Boulevard. This would connect direct with the 24-inch main in said Boulevard and would cross the tracks of the L.S. & M. S., D. & B. C., G. T. and Belt Line R. R's, insuring an ample supply of water for this very desirable business centre, as well as for efficient fire protection.

There are a number of others which might be added to the above, which were mentioned in the last annual report.

Toledo avenue, from Hubbard avenue to Twenty-fourth street, distance about 1,575 feet. By the laying of this line we should get a direct connection with the 24-inch in Vinewood avenue, and would give a better circulation, curing one or more dead ends, and furnish a better supply for fire protection.

Sullivan avenue, from the N. Boulevard to Baltimore avenue, distance about 750 feet. This would also give a direct supply from the 24-inch main in the said Boulevard, thereby adding greatly to the supply for fire protection and curing dead end at Milwaukee avenue.

Appended is a tabulated statement of the pipeage now in use classified by its diameters and lengths.

PIPEAGE.

The amount of distribution pipe and mains laid and relaid, and iron and wood pipe discontinued during the past season, is as follows: Total iron pipe laid and relaid, $32\frac{418}{5280}$ miles, of which 687 feet were relaid and 1368 feet were laid for private use. $1\frac{2818}{5280}$ miles of wood and $6\frac{2410}{5280}$ miles of iron pipe were discontinued, making the net increase of the pipeage $24\frac{121}{528}$ miles. This amount added to the measured lines of iron and wood pipe connected with the works, will make the total length $455\frac{128}{5280}$ miles, of which $452\frac{148}{5280}$ miles are iron and $3\frac{3}{52}\frac{3}{60}$ miles are wood pipe.

Which in detail is as follows:

SIZE OF PIPE IN INCHES.	MEASURED LENGTH IN FEET FOR 1892.	Added Length in Feet For 1898.	DISCONTINUED LENGTH IN FEET FOR 1898.	TOTAL LENGTE IN PERT POR 1995.

It is very gratifying to know that the log or wood pipe-system is rapidly disappearing. From the table of pipeage we see recorded but a little over three miles now in use; and yet this system of logs laid for the conveyance of water has greatly added to the growth of the city and comfort of its citizens, and from the fact of its slight cost, as compared with the cost of iron pipe of that early day, the out-lying streets and the greatly scattered dwellings could not be reached without a burdensome expense to the water takers.

Our 3-inch iron pipe is also diminishing in length from year to year, giving place to pipe of larger size, and whatever of this size may appear in our reports as being laid, it should be remembered that it is not laid in any public street or alley, but is laid for some minor purpose.

The adoption of this size pipe in the early past was to take the place of the logs, this being the most economic size for the times; and while some of the lines of this size may at this late day seem very small for the streets in which it is laid, these streets were but little built upon, and might well be called suburban localities. The policy of the Board at that time was, that as the city developed in size and wealth it would be better able to lay large mains.

During the past year, 536 water gates have been set and 53 reset; 559 were for street shut-offs and 62 for blow-offs; 55 were taken out. These were taken out either for repairs or to be replaced with larger gates, on lines replacing smaller pipe. The following is a tabulated statement of the kind, size and number of the herein mentioned gates:

TABLE OF NEW GATES SET FOR SHUT-OFFS.

There are now 4,867 stop gates in use in the mains and distribution pipes, ranging in sizes from 3 to 42 inches, and, in addition to this number, we have 667 blow-off gates; these are not all located at dead ends, many of which are permanent, set at special points along the lines of pipes.

The appended table gives the length of 3, 4, 6, 8, 12 and 16-inch pipe, and logs which have been replaced with pipe of larger size, in detail, as follows:

	SIZE OF PIPE LAID.					Size		PE AL	ND LOGS	LENGTH OF I	'IPE

There were connected with the water mains 46 hydrants and 15 reservoirs, making the total number now in use 2,338 hydrants and 494 reservoirs.

We have this year done considerable horizontal boring under our asphalt, brick and wood pavements, having a cement concrete foundation, and also under the earth embankments of the railroad tracks. A machine for this purpose was constructed, whereby we have accomplished this work very successfully. The machine is driven by steam power, a small portable engine and boiler doing the work.

The use of this machine has saved much annoyance to the traffic on our busy street crossings, also at the railroad crossing, as would otherwise be had were we to make an open trench as formerly, for our pipe-laying at such points. We have bored for pipe from 6 to 16 inches, the hole being of sufficient size to allow the hub of the pipe to pass freely through the hole, the barrel of the pipe being lagged out to the size of the hub with pine scantling of proper size.

There are quite a number of pipe lines crossing the Chene street 30-inch main that are not as yet connected with the same which it would be well to connect, and a few on the easterly end of the upper 42-inch main in Mack avenue. Quite a number of streets have been opened along these lines since the mains were laid.

REPAIR DEPARTMENT.

This department of the Works has received its usual and efficient attention to the many items of work coming under its care. The foreman and men are deserving of much credit for their efficient services.

I am glad to say that, while there have been quite a few breaks in our pipeage during the past season, only two have occurred in the larger mains. These were promptly met; no serious damage resulting from either of them, other than the bursting of the pipe. The one in the 24-inch main, East Congress street, was found split near its lower side about 4 feet of its length. The defective piece was cut out and a new piece inserted and sleeved up. The one in Vinewood avenue was found ruptured concentric with the axis of the pipe, the ground having settled at this point from the building of a main sewer, which caused the rupture. We were enabled to make repairs without having to shut off the flow of water in the mains—a few pine wedges were driven in the opening and a bolted sleeve leaded in and calked on.

PUMPING WORKS.

Force Mains.—The alterations in the 42-inch mains mentioned in the last annual report, have been made; the arrangement being such that either of the engines can be run in conjunction with or independent of each other, and can be used jointly with either of the two mains, or, with the proposed third main when the same shall be laid.

There is still an apparent need of a further change in the main leading out from No. 3 engine; this would be for a more direct flow through the lower main.

The new engine has been connected with the outlaying force mains. A 42-inch back pressure check valve was set in connection with the said engine and mains.

Conduit.—The building of the brick conduit for the conveyance of water to the above-mentioned engine, was completed early the past season, with all its appendages. The south end, connecting with the west gate and strainer well, and the north end with the suction pipe leading out from said engine, four 48-inch cast-iron curved pipe were required in making the connection.

In closing this report it is only courteous to say that the help in the office of this department has been very efficient. Transmitted with this report are the locations of the pipes and mains, also gates, to January 2, 1894.

Respectfully submitted,

HENRY BRIDGE,
Superintendent of Extensions.

REGULATIONS

OF THE

Board of Water Commissioners

OF THE

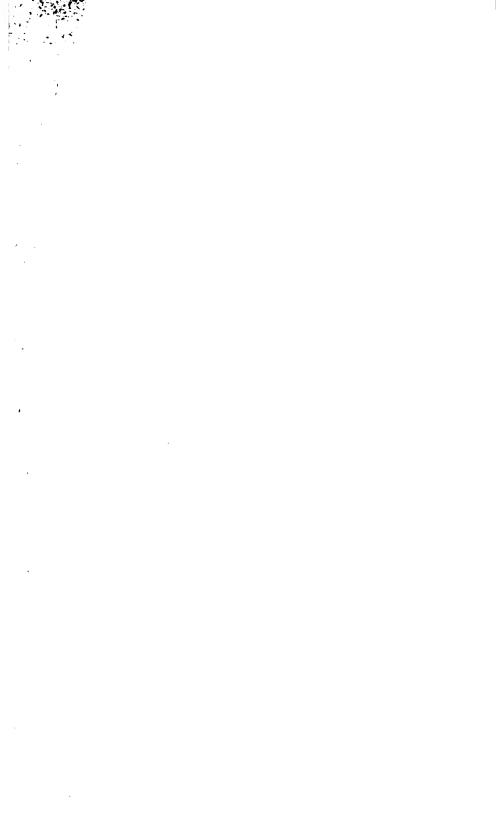

CITY OF DETROIT.

JANUARY, 1894

DETROIT.

THE RICHMOND & BACKUS Co., PRINTERS.

1894.

AN ORDINANCE

OF THE

Board of Water Commissioners.

ADOPTED JANUARY 15, 1894.

It is hereby ordained by the Board of Water Commissioners of the City of Detroit:

CHAPTER I.—THE BOARD.

MEETINGS.

Section 1. The regular meetings of the Board shall be upon the second Wednesday of each month, with the exception of January, in which month there will be to regular meeting.

In lieu thereof, and for the purpose of closing the annual operations of the Board, there will be a meeting on the 30th of December of each year, or, when the 30th occurs on Sunday or Saturday, the said meeting shall be held on the 29th thereof.

Special meetings of the Board may be held at any time, on the call of the President, or upon the written request of two or more members, filed with the Secretary. A majority of the Board shall constitute a quorum.

ORDER OF BUSINESS.

- 1. Reading of the proceedings of the previous meeting.
- 2. Petitions and communications.
- 3. Reports of officers.
- 4. Reports of committees.
- 5. Unfinished business.
- 6. Resolutions, etc.

STANDING COMMITTEES.

Sec. 2. There shall be the following standing committees:

Ways and Means.

Extension and Construction.

Pumping Works.

Supplies.

These Committees shall consist of two members each, appointments to which shall be by the President annually, or when vacancies occur, the President to be ex-officio member of each Committee. The duties of the Committee of Ways and Means shall especially pertain to the finances, and the auditing of bills; the Committee on Extension and Construction to the laying of water mains, the caring therefor, and all construction and repairs that do not properly come under the supervision of the Committee on Pumping Works.

The Committee on Pumping Works, to the supervision of everything pertaining to the pumping of water and the construction and maintenance thereof, as well as the charge of the grounds and their improvement and adornment under the Hurlbut will.

The Committee on Supplies to have supervision of all purchases for the works, except such as are provided for by special act or resolution of the Board, and to direct heads of departments where and in what quantities such purchases are to be made.

CHAPTER II.

OFFICERS.

- Section 1. At the first regular meeting in May, in each and every year, the Board shall choose one of their own number as President and one as Vice-President, who shall hold office until the regular meeting in May in the year next ensuing.
- Sec. 2. There shall be appointed by the Board, should the Board deem it necessary, one General Superintendent, one Civil Engineer, one Secretary, one Superintendent of Extension, one Superintendent of Meters and Inspection, one Engineer and Assistant Engineer, one Storage Keeper, one Superintendent of Grounds under the Hurlbut will, one Receiving Clerk, seven or more Assessors and Collectors of Water Rates, one or more Inspectors, and such other officers as the Board may deem necessary.
- Sec. 3. Every officer so appointed shall, if required, before entering upon the duties of his office, enter into bonds to the Board of Water Commissioners of the city of Detroit, with sureties, to be approved by the Board, conditioned that he will faithfully perform the duties of his office, and will, on demand, deliver over or pay to his successor in office or to the proper officer or agent of the Board, all books, papers, moneys, effects and property belonging to the Board, or appertaining to his office, which may be in his custody or due from him as such officer; and such bond may be further conditioned as the Board shall prescribe.
- Sec. 4. All officers and employes of the Board shall give their whole time to the service of the Board. They shall hold their respective offices and employments during the pleasure of the Board, unless otherwise provided. All officers and employes, unless otherwise agreed upon.

shall receive such compensation as the Board may from time to time deem expedient. It shall be their duty strictly to observe and obey all the rules and regulations of the Board of Water Commissioners, and report to the Board, committee or proper officer any violations of its ordinances or regulations.

PRESIDENT.

Sec. 6. It shall be the duty of the President to preside at all meetings of the Board; to certify all claims allowed by the Board; to sign all checks for money; and to exercise a general supervision over the finances of the Board, and the management of the works. In the absence of the President, or in case of his inability, the Vice-President shall discharge his duties, and in case of the absence of both President and Vice-President the Chairman of the Committee on Ways and Means shall act as President.

SECRETARY.

Sec. 7. The Secretary shall attend all meetings of the Board and keep a record of all proceedings. He shall receive all accounts and demands against the Board, examine them, present them for their action, and after their allowance file and preserve them; countersign all checks for money; and shall make in the month of January in each year a report to the Board of all matters falling within the range of his duties during the preceding year.

GENERAL SUPERINTENDENT.

Sec. 8. The General Superintendent shall have general supervision of the Works and its various departments. All other officers shall be under his direction and control, and it shall be his duty to see that the said officers and employes perform their duties in accordance with the Regulations of the Board. He shall attend all meetings of the Board, and shall make such recommendations pertaining to the operations or construction of

the Works as may seem necessary to him. He shall make, in the month of January of each year, a report to the Board of the general operation and construction of the Works as may be of interest or importance.

It shall be his duty to keep a complete set of books, wherein shall be entered a full and accurate statement of all the receipts and expenditures of the Board. shall especially have general control and supervision of the assessment and collection of the water rates, subiect to the supervision of the Committee on Wavs and Means, and he shall, when the annual assessments are completed, make a written report of the same to the Board. He shall keep in his office a daily journal, in which shall be entered all complaints relative to the supply of water, and orders given to the repairers of leaks in pipes, etc., and all work performed by the same. He shall issue all permits for service connections with distribution pipes. He shall issue plumbers' licenses, under such rules and regulations as may be provided by the Board, and shall make complaint of all plumbers who shall violate the ordinances of the Board governing such work. He shall make monthly statements to the Board of moneys received, the condition of the bank account on the first day of the current month, and such other matters as may be deemed necessary. The book accounts and vouchers in his office shall be examined semi-annually under the direction of the Committee on Ways and Means. He shall give notice of the meetings of the Board, and perform such further services as may be required of him by the Board.

CIVIL ENGINEER.

Sec. 9. The Civil Engineer shall have advisory superintendence over the Works and its different departments to this extent, that he advise with, and make such recommendations to, the Board, or its General Superintendent, concerning anything in said departments that he may deem advisable, and give such advice to the heads of said departments as the said officials may require. He shall have charge, particularly of the system of the supply and distribution mains, and shall make it his especial study and care that the said system be made as complete and perfect as possible, and that proper records be kept of the same.

He shall, in connection with the Superintendent of Extension, advise the Board as to the size of pipe to be laid in any street or alley, upon petitions being received therefor.

He shall make such drawings, plans and specifications as may be required of him by the Board, preparatory to any changes, repairs or construction; and he shall have immediate superintendence of such construction and of such changes and repairs in any department as may be deemed advisable by the Board.

He shall on the first day of each month make a report in writing to the Board in regard to such matters as may have come under his superintendence in extension or construction, and make such recommendations as he may think necessary.

He shall in January of each year make a report to the Board upon all such matters as may have fallen under his supervision during the preceding year, together with such suggestions and recommendations for the future as in his judgment would be for the welfare of the Works.

SUPERINTENDENT OF EXTENSION.

Sec. 9. The Superintendent of Extension shall have a general care of all the water pipes, hydrants, gates and stop-cocks belonging to the Works. It shall be his duty to attend to the sufficiency of supply of pipes, stop cocks, reservoir gates, and all materials whatever, required to meet every casualty or demand, in his department, and to report to the General Superintendent from time to time, what articles are required to be procared. He shall keep an accurate inventory of all tools, implements and materials in his department, and make out a list of all such tools and materials remaining on hand on the first day of January in each year, and report the

same to the Board. He shall give his personal attention to laying such lines of pipe as may be directed by the Board, and all repairs to be made in his department. He shall carefully examine and inspect all of the distribution pipes of the works, with a view to such repairs as may be required to prevent waste of water, and report concerning the same to the General Superintendent, and shall direct the shutting off of the supply of water from such premises as the said Superintendent may direct.

He shall examine all petitions for extension of pipe, report thereon the size, the cost, and the bonus (if any) necessary under the requirements of the Board, and submit the same to the Civil Engineer for approval.

He shall make monthly reports in writing to the Board of all work done in his department during the preceding month. He shall, between the first and tenth days of January, make an annual report to the Board of all matters falling within the range of his duties during the preceding year.

SUPERINTENDENT OF METERS AND INSPECTION.

Sec. 10. The Superintendent of Meters and Inspection shall have supervision of all service pipes and connections whatsoever supplying water to the premises of citizens; and whenever any leaks are discovered in service connections he shall require the same to be forthwith repaired, by the owner thereof, and if the same are not so repaired, to shut off the supply of water therefrom.

He shall have charge of all work done by plumbers and the proper inspection of the same, and shall notify the General Superintendent whenever there is any infringement of the rules and regulations of the Board in this particular.

He shall have charge of the placing of meters and the care thereof, and upon the first day of each month, or as soon thereafter as possible, he shall see that a correct reading of all the meters and indicators be furnished the meter clerk.

He shall have charge of the inspection of premises and the regular examination of all service connections and fixtures.

He shall have charge of the making of all service connections with the supply mains, after permission has been obtained, by the plumber, of the General Superintendent.

He shall, between the first and tenth days of January of each year, make an annual report to the Board of all work done in his department, and shall make at the same time a report of all the tools and materials remaining on hand in his department from carefully prepared inventories of the same. He may also make such recommendations as he may think proper for his department.

ENGINEER.

Sec. 11. The Engineer shall have charge of the engine houses and engines, and the buildings at the pumping works, and shall have supervision of any construction or repairs of any machinery therein. He shall keep an accurate record of the duty of the engines, in such books as may be provided therefor. He shall measure and certify to the General Superintendent the quantity and value of the fuel that may be purchased and received from time to time. He shall keep an account of all labor performed, and certify all claims and demands for labor or materials, done or had, in his department. He shall forthwith report to the appropriate committee all damages to the engines or buildings, or other property under lds charge. He shall purchase such supplies as are required in his department that are not provided for by resolution of the Board or by contracts entered into by the Board, under instructions from the Committee on He shall perform such other duties in conmeetion with his department as may be necessary, and shall conform to such instructions as he may, from time in time, receive from the Board, or the proper committee, He shall make monthly written reports to the Board. He shall make an annual report showing the quantity

and cost of fuel used, and an inventory of all material on hand, and may also advise the Board as to further operations in his department.

SUPERINTENDENT OF THE GROUNDS.

Sec. 12. The Superintendent of the Grounds around the pumping works shall have charge of the same and of all work performed thereon, under the immediate control of the Committee on Pumping Works.

He shall have charge of all men employed in beautifying and improving the grounds under the Hurlbut will and shall keep a list of all tools and materials belonging in his department. He shall, between the first and tenth days of January of each year, make a report to the Board of all work performed in his department, together with an inventory of all properties in his possession, and may offer such recommendations as to future work on the grounds as may seem best to him.

ASSESSORS AND COLLECTORS.

Sec. 13. The Board may divide the city into such number of collection districts, and appoint such number of Collectors as it shall deem expedient. It shall be the duty of the several Collectors, between the first day of May and the first day of July, in each year, to make an assessment upon all persons using water from these works, and report the same to the General Superintendent. They shall also make all subsequent assessments.

Great care must be taken that the assessments are correct, and to do this the Assessor must not go upon any previous knowledge that he may possess, except in regard to fixtures, but must faithfully examine every premise.

The assessment books must be written up and the office books copied therefrom, as the blanks require; the lot, block, frontage and farm correctly entered; and the cross streets defined by a red line, either above, below,

en both all maximes of streets, or sides of streets, supported to the streets of page, must be defined by red into Atom 224 work

and aggregated by the Assessors, and fistrict, and the assessments on the and be footed and aggregated in the same in Landor other than the one that made and aggregates certified to by the aggregates certified to by the

will report for duty in office the last the first part of each quarter, the entire man is a squarter, and such a first part of each nomes as the General Superintendent may determine to propose of receiving rates and performing the part was as may be necessary.

in the second and third months of each quarter as its second second and third months of each quarter as its second second may direct.

was their duty in the second and third months ment arer, to call upon all water takers within more reserves who have not paid their rates for the curand to leave on the premises a notice that water rates and percentage are paid on or properties expiration of such quarter, the water will be without further notice; and the Collectors shall at the end of every such quarter, report to the Superintendent the names of all those who have with such demand, and to whom such makes have been given. And it shall be the duty of the Superintendent, upon receiving such report, to water to be shut off in all cases where the and percentage remain unpaid. It shall be their with the give receipts for water rates received by them with each assessment, and to preserve was such receipts. At the expiration of each manth the Collectors severally shall make out state and all moneys collected and paid over by them Maring the month. They shall, promptly, pay over to the

Receiving Clerk all moneys received by them. They are especially charged with the duty of seeing that no person or persons use water from these works without paying therefor.

, Sec. 14. Receipts, and stubs therefor, shall be filled out completely, as the blanks require.

At the time of making a receipt the Assessor shall enter the amount so received in the Collector's book, and, at such time as is convenient, these stubs shall be posted in office book and the number of the stub placed over such posting by an Assessor other than the one making the receipt, and all "losses" or "gains," on such stubs, shall be recorded in books prepared for this purpose, by the Assessor posting in office book. The Assessor so posting will certify to the correctness of such stubs opposite the last stub in each settlement.

The Assessors are required, before leaving the office, in second month, to see that all stubs are posted, all loss and gain recorded, and, upon office book opposite, such premises as are delinquent in payment more than the ensuing quarter, all memorandums that may be pertinent to the collection of such rates, such as "shut for non-payment," "shut for vact.," etc., etc.

They will verify, each in his own district, stubs made by the Receiving Clerk during second and third months.

Sec. 15. The Meter Clerk shall perform such duties as are herein described, and such other duties as he may be called upon to do, from time to time, by the Superintendent of Meters, under whose direction and control he will be. He will occupy his desk during the office hours of the Board, unless excused therefrom by the said Superintendent or the General Superintendent, and shall perform the following duties:

He shall have custody and charge of all the books and papers necessary to the collection of Meter Rates, and the keeping of a correct record of the same.

He shall have supervision of the work of reading the Meters in the City, which shall be performed on or before the first day in each month, and shall keep a complete record of such readings upon books prepared for that purpose.

He shall immediately upon ascertaining such readings, transcribe the same upon bills prepared for that purpose, said bills to state amount of water consumed, and the sum due the Board therefor, and present them for payment to the parties from whom the payment is due.

He shall receive all moneys paid to the Board for water consumed through meters, and shall keep a correct record of such payments upon Receipt Stubs and also upon the Books of Record above referred to.

He shall promptly pay over to the Receiving Clerk all moneys received by him, and at the end of each month he shall make a written statement to the General Superintendent of the said receipts.

He shall, on the 20th day of each month, or as soon thereafter as possible, prepare a list of such consumers who are in arrears for the payment of their rates, and present the same to the Superintendent of Meters, who shall cause in such case the water to be shut off until the amount of the delinquent rates and percentage be paid.

Meter Rates, as per resolution of the Board previously adopted, are required to be paid on or before the 15th day of each month, and if not paid as required. Five per cent will be added to the amount due. If not paid on or before the 20th of each month, the water will be shut off, as before provided.

RECEIVING CLERK.

Sec. 16. The Receiving Clerk shall receive all moneys paid for water rates, for materials or for any other pur pose, and keep a correct record of the same upon books provided him for that purpose.

He shall deposit all moneys so received in such bank as may be designated by the Board.

During such portions of the second and third months of each quarter, when the Collectors are serving notices, he will receive water rates, giving receipts therefor, the stubs of which, together with the stub number, will be posted in office book by the Assessors, as designated by the General Superintendent from time to time, and in the Collectors' books, each in his own district, who will also verify the stub additions and their entries in the cash book.

Sec. 17. The Receiving Clerk, in connection with the duties already imposed upon him, will verify the settlements as made by the Assessors, personally, as to the similarity of totals in settlement book and on stubs, and as to the fact that the stubs are settled for continuously; and will also see that the footings on stubs are verified; that the said stubs are properly posted and promptly settled for. He is particularly charged with the duty of seeing that the Assessors and Collectors comply with the regulations governing their duties.

His instructions in regard to the Collectors applies to the Meter Clerk and Permit Clerk as well.

STORAGE KEEPER.

Sec. 18. The Storage Keeper shall reside on the Storage Grounds and shall have charge of the said grounds. He shall have charge as custodian of all properties of the Board, iron pipes, special castings, etc., that are stored there from time to time, and shall keep a correct account of the same and furnish an inventory thereof, whenever he may be required so to do.

He shall have charge of the houses located in the Storage Grounds, and of the men employed in said grounds, and of the horses stabled there.

He shall, in his care of the grounds, promptly eject any visitor who shall commit any nuisance or trespass upon the premises.

INSPECTORS.

Sec. 19. The inspectors shall examine and let on new

connections, make and keep in proper books a record of gates and stop-boxes, and, under the direction of the Superintendent of Meters and Inspection, shall enforce the regulations of the Board in regard to the character of plumbing in private premises, reporting promptly to the said Superintendent all violations of the same. They shall enforce under the direction of the Collectors payment of rates assessed for special purposes; and perform such other duties as the Board shall direct.

PERMIT CLERK.

Sec. 20. The Permit Clerk shall have charge of the issuing of permits to plumbers, and the keeping of the records of the shutting off and the letting on of water in private connections for any purpose whatsoever.

He shall also receive all delinquent water rates due upon assessments previous to the present one, and in such collection shall be governed by the rules applied to the Assessors and Collectors.

He shall report each month's receipts, losses and gains, to the General Superintendent and to the several Assessors.

CHAPTER III.

PLUMBERS AND PLUMBING.

- Section 1. No person shall make any attachment or connection with the pipes of the Water Works, nor make any repairs, additions to, or alterations of, any fixtures connected with service water pipes, unless licensed as a plumber.
- Licensed plumbers must be residents Detroit, and not less than twenty-one years of age. They must be regularly educated plumbers, masters of their They must have established places of business, with proper signs thereon, designating name and nature of business, or be employed by business firms having such requirements, and who are upon their bonds for the correct performance of their work. Each person licensed shall pay therefor the sum of five dollars. licenses will expire on the first day of May subsequent to the date of their issue. The license of any plumber may at any time be suspended or revoked by the Board of Water Commissioners for violation of any of their rules and regulations. At the time of receiving a license. the party licensed shall execute and file with the Board of Water Works Commissioners a bond, approved by the General Superintendent, in the sum of five hundred dollars to indemnify and save harmless the City of Detroit from all damages and losses that may result from careless or imperfect workmanship, or by reason of failure to comply with the requirements of the Board of Water Commissioners.
- Sec. 3. Plumbers, to obtain such licenses, must comply with such regulations as the Board may adopt from time to time.
- Sec. 4. Plumbers must make application to the General Superintendent for permission to perform all work, whether upon new or old connections, unless it be simply

we repairs, before commencing such work, upon blanks we had them at the office of the Board.

Sec. 5. They will leave the water turned off in cases a new connections or on premises where it was turned off previous to their making any repairs or alterations of existing fixtures. They will afford proper opportunities for inspection by the Board of new service pipes before covering the same, and therefore, no service pipe, wher outside or inside the "stop," shall be covered before such inspection. Pipe covered contrary to this regulation will be again exposed for inspection, and no further permit will be granted the plumber until this requirement is fully complied with.

No plumber shall allow his name to be used by any other party, directly or indirectly, for the purpose of doing work, or obtaining permits under his license.

- Sec. 6. Before receiving a permit to connect the service or supply pipe with the iron pipes, there must be paid such sum as the Board may require to cover the expense of the service cock and inserting the same, which service cock will be inserted by persons employed by the Board for that purpose.
- Sec. 7. All service pipe connecting with the distributing pipes of these works, shall be made either of cast iron, block tin, lead, or of such other material as may be approved by the Board. The lead service pipe to be used in making connections with the pipes of the works, either within the building or in the ground, shall not be lighter than "strong" for all sizes, and all joints thereon shall be "wiped." Cup joints will not be permitted. All stop or hydrant faucets connected therewith, shall be perfect and made of good material, and all such service pipes must be at least four feet below the surface of the earth. Service pipe must not be laid in sewer ditch, but must be laid at least 18 inches therefrom.

Where premises have cellar or basement service pipes will be extended into same before any branches are taken therefrom for any purpose whatever. This restriction includes connections for hose, outbuildings, etc.

A valve for shutting off the water will be required to be placed in said service pipe immediately inside cellar or basement wall.

Sec. 8. The Board reserves the right to attach a meter to any service pipe, at any time whenever it shall deem it expedient so to do, and thereafter charge for the quantity of water measured or used, instead of the yearly schedule rates before charged. After said meter is so attached, and notice thereof served upon the owner, agent or tenant of the premises, any damage which said meter may sustain resulting from the carelessness of said owner, agent or tenant, or from the neglect of either of them to properly secure and protect the same, as well as any damage which may result by hot water or steam setting back from a boiler, shall be paid to said Board on presentation of bill. And in case said payment is not so paid, it is understood and agreed that the water may be shut off from said premises without notice and will not be turned on again until all charges are paid.

And all persons are hereby forbidden to interfere with or remove a water meter from any service where it has been attached without first receiving permission from the proper officers of said Board.

On such connections as the Board may desire to place a meter, there shall be a suitable place provided therefor, free from all danger of frost and perfectly accessible, and owners or occupants are strictly prohibited from placing any obstruction over box containing meter, or to interfere with the reading thereof.

Sec. 9. All connections heretofore or hereafter made with these works shall be provided with a good and sufficient stop-cock therein, which shall be protected by an iron box leading from the same to the surface of the earth, and covered with an iron cover with the letters "water" thereon, and be so exposed as to be easily found; and the same shall be placed outside of the lot, within one foot of the line, or inside the curbstone within one foot thereof.

Sec. 10. It is expressly forbidden any plumber to lay inside of premises a service along any outside wall or in any position where there is danger of frost, or to make any new connections or attachments thereto, or any new attachments or fixtures to old connections, that shall require a running stream, to prevent freezing, or for any other purpose, unless special permit is granted therefor.

Sec. 11. All water closets hereafter connected with service pipes must be provided with appliances approved by the Board. Under no circumstances will rod water closets be permitted. Every service pipe must be fur nished with a stop and waste-cock below the action of the frost, so situated that the water can be completely shut off and drained from the pipes to prevent freezing.

Sec. 12. Where larger connections than one inch are made, the gate controlling such service pipe shall have a stem the head of which shall be as follows: 2 inch or under, 1½ inch square head; 3 inch or over, 2 inch square head.

Sec. 13. In all cases where one connection is intended to supply more than one tenement, shop, store or building, it shall be the duty of the person making such connection, or causing the same to be made, to lay down a branch with stop-cock for each, outside the line of premises so to be supplied, to be covered and marked as provided for in section 9.

Special permission will be granted, however, by application to the Superintendent of Meters, for one pipe, with meter thereon, to be put in supplying the whole premises. In cases where other service pipe is required than that already in premises, the plumber must disconnect the service pipe already in at the main, unless special permission is given allowing it to remain. Plumbers will therefore inform themselves as to the condition in all old premises before taking out a permit.

Sec. 14. All work performed by plumbers shall be subject to inspection under the direction of the Superintendent of Meters and Inspection, who has authority. hereby granted him, to order any part of such work to be discontinued or changed in order that the same shall comply with the regulations and requirements of the Board.

- Sec. 15. It is expressly required that new connections shall be ready for inspection and tapping at 12 noon; and in case the work is not ready for the tappers, and a second visit is necessary, an additional charge of at least \$1.00 will be required to be paid.
- Sec. 16. The failure to perform work in accordance with the above regulations shall subject the plumber, in the discretion of the Board, to a temporary or permanent forfeiture of his license.

CHAPTER IV.

WATER RATES AND ASSESSMENTS.

- Section 1. The rates to be charged for water on each house or other building having or using water, and upon the lot or lots upon which such house or other buildings are situated, shall be annually assessed by the Collectors, or such other persons as may be designated by the Board, before the first day of July in each year; and the amount charged shall be for one year, commencing on the first day of July and ending on the thirtieth day of June next ensuing.
- Sec. 2. If any such lot or lots shall lie partly in two or more wards, the same shall be assessed in the ward where such building is situated. The Assessor shall describe the premises thus assessed, by referring to the number and section of the lot or lots, and shall describe all such lot or lots, or subdivision thereof, by referring to the number and section of the lot, and the owner or occupant thereof; and if the number and section of any lot, or the owner thereof cannot be ascertained, then by such other sufficient description as the Assessor may deem proper; and if by mistake, or otherwise, any person may be improperly designated as the owner of any lot or premises, such assessment shall not for that cause be vitiated, but the same shall be a lien on such lot or prem ises, and collected as in other cases.
- Sec, 3. There shall be made out and completed assessment rolls, in books to be provided by the Board for that purpose. Such rolls shall be signed by the Collectors respectively, or such other person as may make the assessment. After signature, the rolls severally shall be delivered to the General Superintendent of the Board, and shall be open for the inspection of all persons interested, at the office of the Board, and any person consid-

ering himself aggrieved by reason of any assessment may complain thereof to the Board of Water Commissioners. The Board shall, on the last business day of June in each year, meet at their office for the purpose of reviewing, correcting and approving said rolls. The General Superintendent shall cause notice of such meeting to be published in the daily newspaper published by the printer for the city, and in one other daily newspaper published in said city, for at least one week prior to the time appointed for such meeting of the Board, stating that said assessment rolls are completed and open for inspection, the time and place of meeting of said Board, and the object for which it will meet.

Sec. 4. Any person considering himself aggrieved by reason of any assessment, may complain thereof, verbally or in writing, before the said Board, and on sufficient cause being shown, by the affidavit of such person, or by other evidence to the satisfaction of such Board. they shall hear and determine such matter in a summary manner, and correct any errors which they may discover in the assessment rolls, and alter and correct the same. The concurrence of a majority of the Board shall be sufficient to decide any question of alteration or correction of any assessment complained of. The Board, or majority of them, having completed the review and correction. of the assessment rolls, shall, if any corrections are therein made, cause said corrections or changes to be noted and written upon said rolls, and the President shall sign the same.

Sec. 5. The rates, when assessed and confirmed by the Board, shall be final and conclusive, subject only to revision by the Board, except as herewith provided. A notice filed in the office of the Board that the consumption of water has been decreased, either by a reduction of the number of families, the disconnection by a licensed plumber of fixtures, or for any other cause whatsoever, will entitle the premises to a new assessment from the beginning of the quarter after the notice is filed; said new

assessment to be contingent upon the present and future uses of water.

Sec. 6. The Collectors shall make all assessments that shall become necessary subsequent to the annual assessment, and place the same upon the assessment rolls.

Sec. 7. The rates for all premises using water shall be due and payable quarterly in advance, at the office of the Board of Water Commissioners, to wit: On the first days of July, October, January and April. If not paid in those months, the Collectors shall proceed to deliver notices demanding payment thereof, and shall add to the assessment a sum equal to five per cent thereof; and if not paid until the expiration of the quarter, ten per cent shall be added. In default of payment until the expira tion of the quarter, the water may be shut off; and the water may be withheld from any person who is in arrears for water rates until the amount due is paid, and in addition thereto the further sum of fifty cents for shutting off and letting on the water whether such premises are occupied by the same or other persons; and in cases where extra labor may be performed to shut the water off from said premises, a just compensation shall be paid therefor before the water is again let on; and the water may be withheld from any person who may be in arrears for water rates, until the amount is fully paid. whether such person resides on the premises where the water was used, for which they may be in arrears, or on any other premises. The supply of water may be with held from premises occupied by more than one family using water from the same connection, unless the owner of such premises pays the water rates assessed thereon: and where more than one assessment is made for water used from the same connection, in case of the neglect or refusal of any one so assessed to pay the amount of water rate, the water may be shut off from such connection.

For the collection of meter rates see Sec. 15, Chap. 2. Sec. 8. Every rate or assessment shall be and remain a lien upon the lands and premises assessed from and

after the time such rates or assessments shall become due and payable as aforesaid; and if there be a default in paying the same or any part thereof for a longer period than six months, the Board may cause a notice to be published in the daily newspaper published by the printer for the city once a week for four successive weeks and posted in three or more public places in each ward requiring the owners or occupants of, or parties in interest in such lands, hereditaments or premises, to pay such rates or assessments; and that if default be made in making such payment, such real estate will be sold at public auction at a day and place specified in said notice, for the lowest term of years at which any person shall offer to take the same in consideration of advancing and paying such assessed water rates or assessments upon the lots, with the costs and charges in the premises.

Sec. 9. If the owners or occupants of, or parties in interest in such lands, hereditaments or premises, do not pay such water rates or assessments, with the costs and charges, within the period above prescribed for the publication of said notice, then the Board shall, without any further notice, cause such lands, hereditaments, or premises, to be sold at public auction for the lowest term of years at which any person shall offer to take the same in consideration of advancing the water rates or assessments, with costs and charges, and shall execute a proper certificate of such sale to the purchaser thereof; and if such lands, hereditaments or premises shall not be redeemed within one year after such sale thereof, as hereinafter provided, the General Superintendent of the Board, in the name of and for the Board of Water Commissioners of the City of Detroit, shall execute and deliver to such purchaser or his assignee a proper deed for the conveyance of such real estate for the term for which the same was sold. And in all sales as aforesaid. if the purchaser or his assignee shall die before the deed or another conveyance shall be executed, the deed may be executed to, and in the name of, the deceased person, if such deceased person, being still alive, would be

entitled to a deed or conveyance; which deed or conveyance shall vest the title in the heirs or devisees of such deceased person, in the same manner, and liable to like claims of creditors and other persons, as if the same had been executed to such deceased person immediately previous to his death; or the executor or administrator may assign the certificate of purchase, and a deed or convey ance may issue to the assignee thereof.

- Sec. 10. When any lands, hereditaments or premises shall be sold as aforesaid for the payment of water rates, or of assessments aforesaid, if the owners or occupants of, or the parties in interest in the same, shall, within one year after such sale, deposit with the General Superintendent of the Board, for the use of the purchaser, the full amount of such water rate or assessment for which the sale was made, together with interest thereon, from the time of sale, on the amount of the rate or assessment, together with the amount of costs and charges, then the term for which such real estate was sold shall cease and be determined at the time of the making of such deposit.
- Sec. 11. It shall be the duty of the General Superintendent of the Board to bid in for said Board at any sale of lands, hereditaments or premises for water rates or assessments, every lot and all premises for which no other person shall bid. And if any purchaser shall refuse or neglect to pay the sum or sums bid by him, upon demand by the said Superintendent, said bid shall inure to the use and benefit of the Board, if they so elect. Upon all such bids by the said Superintendent, and all bids for the use and benefit of the Board, conveyances and certificates of the sale shall be executed by the Superintendent to the said Board, and be acknowledged by him; and, when duly acknowledged, they may be recorded as other conveyances of land under the laws of this State.
- Sec. 12. The General Superintendent of the Board shall, within thirty days after such sale as afore-aid, make a correct record showing the time when the water rates and other assessments were levied, and the amount

thereof in each case, the amount of costs and charges, the time when the sales were made, the names of the purchasers, and the term for which the same was bid. And said record shall be deposited in the office of the Board, and shall be subject to inspection during office hours.

- Sec. 13. It shall be the duty of the General Superintendent to contract on the best terms in his power for the publication of the notices for the sales aforesaid. In such contract there shall be a provision for the price or cost of the advertising of each description. The cost or price of such advertising shall be added to the amount of the assessment applicable to the premises specified in such description.
- Sec. 14. It shall be the duty of the General Superintendent to obtain, file and preserve affidavits of the due publication of all such notices as are required to be given by this ordinance.
- Sec. 15. Before water is used for building purposes, the owner of the premises shall obtain a permit therefor by paying an assessment based upon the architect's estimates of quantities. Water used in violation of this rule will be shut off, and assessments for such as shall have been used shall remain against the building until paid.
- Sec. 16. The scale of water rates shall be such as is now or may be hereafter established by the Board.
- Sec. 17. Where a continued flow of water is desired, the pipe where the water is delivered shall be of such size as will deliver the quantity desired, and the assessment shall be for the measured capacity of the pipe.
- Sec. 18. Proper reduction in water rates may be made by the General Superintendent, and all disputed rates must be settled at his office.

CHAPTER V.-Supply of Water.

PIPES.

numbers for the extension of water pipes shall be delived to be superintendent of Extension, whose duty it shall so inspect the proposed line, measure the distance tasks an estimate of the cost of constructing the same associate probable income which would be need therefrom, and report to the Board without innersorry delay.

CONNECTIONS.

- 2 It shall be the duty of every person whose the class are supplied with water, to prevent other persons from procuring water from such premises, except the written permit of the General Superintendent of the Board, and if he knowingly permits such use his second may be increased.
- So. 3. The supply of water may be withheld from the costs when the ordinances, rules and regulations of the Beard have in any manner been violated. If any person shall, after the water has been shut off from any pomise cause or suffer such premises to be supplied with water, without permission, such premises shall be connected from the distribution pipes of the water works.
- Sec. 4. The officers and employes of this Board may, at all seasonable hours, enter upon any lot or premises, to inspect the condition of the water works, and make such alterations and repairs or do such other acts as shall be deemed by them necessary; and any person whose premises are supplied with water, shall be deemed as assenting to the rules and regulations of the Board.

- Sec. 5. The premises of any person adjacent to any street or alley through which the water pipes are laid, may be supplied with water by application to the General Superintendent. All of the connections thereto shall be made only by a plumber, duly authorized and licensed by the Board. All such connections must be made in conformity with the ordinances and regulations of the Board. In case the person or persons whose premises are to be supplied with water shall procure the work of said connections and attachments to be done by any other person than the licensed plumber, who may be named in said permit, the Board may, at its pleasure, withhold the supply of water from the premises aforesaid.
- In regard to the provision requiring iron stopboxes, as specified in Sec. (9), "Plumbers and Plumbing." in cases of connection heretofore made, the occupant of the premises, or, if the same be unoccupied, the owner thereof, if resident of the city, and if the owner be non-resident, then the agent, shall be notified of the provisions of this section, and shall at the same time be notified that if the same are not complied with within fourteen days from the time of such notification, the supply of water will be shut off. Water rates on said premises shall not thereafter be received until the provisions of this section are complied with. If the provisions of this section shall not be complied with within the time limited by such notification, the supply of water shall be shut off unless the period for which the water rates upon said premises shall have been paid shall not have expired, in which event the water supply shall be shut off as soon as such last mentioned period shall have terminated.
- Sec. 7. If the connection or branch pipe, stop or hydrant cock, through which the premises of any person are supplied with water, shall be out of repair in any manner, it shall be the duty of such person forthwith to have the same repaired.

HYDRANTS.

Sec. 8. When hydrants are exposed to general use, it shall be the duty of the owner of the premises benefited to construct or alter such hydrant in such manner as to draw the water by a key to be removed from the hydrant when not required for the purpose of procuring water, and the supply of water shall be shut off from all hydrants thus exposed in violation of this provision.

FOUNTAINS.

Sec. 9. Private fountains or jets shall not be used more than three hours each day, unless specially permitted, with payment of additional assessment; and the right is reserved to suspend the supply of water to all fountains, either public or private, whenever, in the discretion of the Board, the public exigency may require it.

METERS.

- Sec. 10. Meters shall be placed wherever it may be deemed best by the Board, and especially where large quantities of water are required or flowing streams, or in cases where, from the nature of the business, it is reasonable to suppose there is considerable waste.
- Sec. 11. The expense of purchasing and placing meters upon service pipes connected with the Works, shall be borne entirely by the Board, and all meters so placed shall remain the property of the Board and be under its sole supervision and control.

WASTE.

Sec. 12. Any person who shall waste the water on his premises or permit such waste, shall be liable to have his assessment increased in proportion to such waste, such increase to be collected the same as other assessments, or, in the discretion of the Board, the water may be shut off entirely, or a meter be placed thereon.

CHAPTER VI.

Section 1. This ordinance shall take effect and be in force from and after the fifteenth day of January, 1894, The water rates shall continue as now established until otherwise directed by the Board. All other ordinances. and all rules and regulations contravening this ordinance are hereby repealed. The adoption and passage of this ordinance shall not be construed to operate to discharge any person guilty of any violation of such repealed ordinances, rules or regulations, or to invalidate any vested rights of the Board of Water Commissioners, or of individuals, or the acts or proceedings of any officer or agent of said Board had or done in accordance with such ordinances, rules or regulations now repealed; but all such rights are hereby retained.

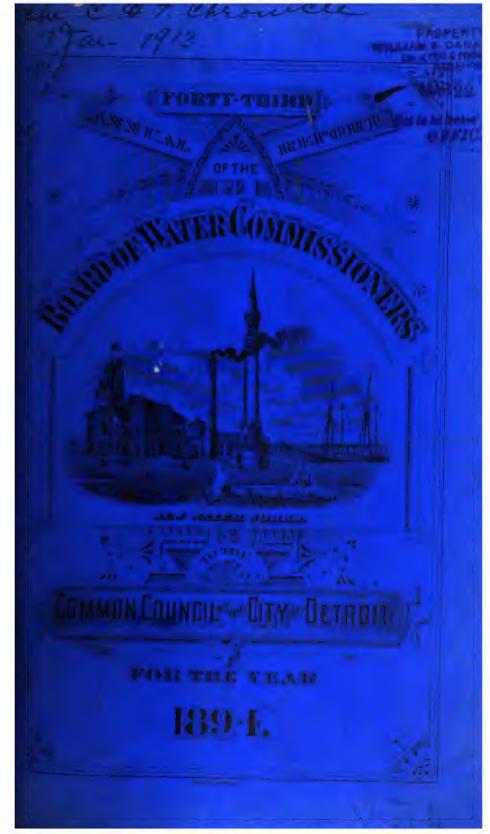

PENALTIES.

[Extract from an Act of the Legislature "To amend the Laws relative to 'Supplying the City of Detroit with Pure and Wholesome Water,' and to provide for the completion and management of the Detroit Water Works," approved April 12, 1873.]

If any person shall willfully do, or cause to be done, any act whereby any work, materials, or property whatsoever, erected or used within or without the City of Detroit by the Commissioners, or by any person acting under their authority, for the purpose of procuring or keeping a supply of water, shall be injured, or shall willfully throw or place, or cause to be thrown or placed, any carcass of any dead animal or person, or any other deleterious or filthy substance whatever, in any reservoir, pipe, or aqueduct of said Board, through which water for public or private use is conveyed, or shall throw or place, or cause to be thrown or placed, any such carcass, deleterious or filthy substance into the Detroit river or Lake St. Clair, within a distance of six miles above any inlet pipe of said Board extending into said river, and through which said supply of water or any thereof is received, or do, or cause to be done, any other act to willfully pollute said water, he shall be guilty of a misdemeanor, and upon conviction thereof shall be punished by a fine not exceeding five hundred dollars, or imprisonment in the House of Correction for a period

not exceeding two years, or both, at the discretion of the court before which the case is tried. The Commissioners shall erect notices of so much of this section as relates to reservoirs and the Detroit river and Lake St. Clair at conspicuous points on such reservoirs and along the American shore of said river and lake within the distance above mentioned, and for this purpose they or their agents shall have the right to enter upon private property.

"Sec. 22. If any person shall, without authority of the Commissioners or their proper agents, perforate or bore, or cause to be perforated or bored, any distributing pipe, main, log, or aqueduct, belonging to said works of this Board, or make, or cause to be made, any connection or communication with said pines, aqueducts, or logs, or meddle with or move the same, or any machinery, apparatus, or fixture of the Board, or take down or deface any of the notices provided for in the last section, or cause the same to be done, the person so offending shall. on conviction, be punished by a fine not exceeding one hundred dollars, and shall also be sentenced to imprisonment in the Detroit House of Correction until such fine be paid, not exceeding six months. Any person who shall willfully and maliciously break or cut any inlet pipe, main distributing pipe, log, or aqueduct, used by the Commissioners for conducting said water, or shall dig into, or break up, any reservoir filled, or partially filled, with water, or shall break or injure any pumping engine, or any part thereof, or any of the machinery connected therewith, belonging to said Board, or cause any of said acts to be done, shall be deemed guilty of felony, and upon conviction thereof shall be punished by imprisonment in the State Prison not more than five vears, or by a fine not exceeding one thousand dollars, and imprisonment in the jail of said Wayne County not more than one year. All violations of the provisions of this act shall, when committed within the limits of the City of Detroit, be tried in the Recorder's Court of said city, and when committed beyond said limits, they shall be tried in the Circuit Court for the County of Wayne."

REPORT

OF THE

BOARD OF WATER COMMISSIONERS

OF THE

CITY OF DETROIT.

WATER COMMISSIONERS' OFFICE,

DETROIT, January 2, 1895.

To the Common Council of the City of Detroit:

GENTLEMEN—The Board of Water Commissioners respectfully submits its annual report for the year ending December 31st, 1894. The reports of its General Superintendent, its Civil Engineer and the Heads of Departments are presented herewith, giving in detail the operations of the Board, to which your attention is earnestly invited.

The construction of the new engine, the building of the Hurlbut Memorial Gate, and other general improvements at the Pumping Works grounds, are now completed.

The pumping capacity, with all four engines running, is over one hundred million gallons per day, a condition that will prevent "short supplies," as far as this part of the works is concerned, for some years.

The laying of an additional force main is arranged for and the pipe necessary thereto contracted for, and will be delivered early in the coming year.

The operations of the Board in the past year, especially in the laying of water-pipe, have been conducted largely with a desire to provide work for the unemployed, and much has been done that was not immediately necessary, because of that. Much of the labor has been furnished by the Poor Commission, and while ordinarily this class of labor is by no means the most profitable, yet we are happy to state that the results obtained are as good as those of former years.

The principle of conducting the Works in the interest of the people, which is to furnish the best possible results at the smallest possible expense, prevails with the Board as strongly as ever; and when it is known that we pumped less water in 1894 than was pumped in 1888, that the population has increased 63,838 in the meantime, that the operating expenses of the Board were but \$800 more in 1894 than in 1888, and that the average increase of pressure throughout the city is full 34 per cent. greater, it certainly seems that the claim is fully established.

In contemplating the laying of the additional force main to the city, the Board saw the necessity of issuing an additional \$100,000 of bonds, under the act of 1873. Under resolution of the Board November 6, 1894, these were advertised, the result of which, though coming in the following year's operations, yet being previous to the date of the submission of this report, we herewith include. The highest bid, and the one accepted, was from Rollins & Sons, of Boston, and was \$111,110. The bonds were gold-bearing four per cents. These are the first bonds issued by the Board since 1881, and in the meantime \$519,000 of outstanding bonds have been redeemed from its resources.

Which is respectfully submitted.

HENRY M. DUFFIELD.
FRANK E. KIRBY,
ALBERT L. STEPHENS,
DEWITT H. MORELAND,
EDWARD W. PENDLETON,

Commissioners.

REPORT

OF THE

GENERAL SUPERINTENDENT AND SECRETARY.

JANUARY 2d, 1895.

To the Board of Water Commissioners:

GENTLEMEN—I herewith respectfully submit my report of the general operations and construction of the Works for the year 1894.

The several departments, under the control and management of the Superintendents thereof, and the operations therein in detail, will be found in accompanying reports. They are of sufficient interest to invite the closest perusal, and indicate, what is a fact, an earnest, intelligent and honest performance of the trusts reposed in them.

In visiting other Works, or in studying the reports of their various operations, I turn with relief to the careful and economic measures of this Department, and reflect with pleasure upon the unanimity that prevails, and the earnest desire to perform their duties faithfully, that actuates the employés of the Water Works of the City of Detroit.

IRON PIPE DEPARTMENT.

The past year has been, in this department, an eventful one. Early in the year the superintendency was vested in the Civil Engineer, with Mr. Bridge as Assistant, in order that the former official might have direct charge of work that was to be performed under a plan which he had recommended to the Board, and which he desired to direct personally. Without entering into a discussion of this question, or giving its history,

I will simply say that the Board determined, after a fair trial, to abandon it, and Mr. Bridge was again placed in charge and the work again proceeded as had been the custom for years.

During the year very much of the work has been conducted with a desire to provide labor for the unemployed; and, in order to reach the greatest number, I have acted under instructions from your honorable body and laid off the men after two weeks' work and taken on new men, largely furnished by the Poor Commission. It was feared that this manner of proceeding would materially increase the expense of laying waterpipe, but by a careful comparison with the cost of former years it was found that there was but little, if any, difference in the cost. The men seemed to make up in eagerness and gratitude for an opportunity to earn a few dollars, what they lacked in experience.

I desire here to make mention of an employé in this department who, by a little ingenuity, saved considerable in the expense of testing pipe in the ditch. The tests usually were made with a portable engine drawn around by horses, and there was substituted therefor, under the suggestion of S. G. Howe, a hand pressure pump, which could be carried around by hand, and, with the addition of certain attachments, was fully as effective in accomplishing desired results as the more cumbersome and expensive steam pump.

The purchasing of horses for doing the hauling of the Board was a wise one, as the gradual and steady increase of this class of work has rendered the time fully ripe for such proceeding. If the teams are kept as busy as the amount of work of the past year would seem to indicate, a saving will be effected in this expense of fully 50 per cent.

The perfecting of the pipe system under the direction of the Chief Engineer has steadily proceeded, until at the present time practically none of the serious deficiences thereof and their consequent annoyances to the Board and myself seem to exist. The daily complaints of the past, the cause for which I struggled to do away with, but which I only partially accomplished, are now things of the past. It is now a most uncom-

mon thing to receive complaints of short supplies, and they are always found, upon investigation, to be due to local troubles rather than to any fault in the system.

Last August, owing to ever-occurring breakages in the valves of the system, caused by their being operated by inexperienced men in the iron pipe department, I organized a small gang of men under John Bridge and placed all the valves under his direct charge, instructing him to proceed at once to a thorough and systematic examination of them. At my request he has made a report of his five months' operations and which I have appended to my report, as it is full of interesting information.

PUMPING WORKS.

The pumping capacity of the Works is now, with all engines running, over 100 million gallons per day. The engine house, instead of being dwarfed by the additions at either end to accommodate the two engines purchased last, seems to have needed these two extensions to perfect it architecturally; and the condition of the grounds has experienced such a marked improvement as to render them one of the most attractive features of our city,

Chief Engineer Gould has not simply contented himself with doing well with what he had to do with, but has exercised in several instances his inventive genius to improve his conditions. The most marked of these actions was his arrangement by which the engines could be converted in five minutes from "double pumps" to single acting. There is a minimum as well as a maximum capacity to the engines, and it often happens at night that the minimum capacity is too great, in which event it was customary previously to help along in the great "waste" act by opening the waste gate and letting the surplus run back into the well. The arrangement, which is the result of his thought and study, practically unships one of the pumps, and reduces the capacity of the engine to the volume of water required of it, thereby doing away with any necessity and expense of pumping the water up hill simply to see it run down again.

Mr. Scribner, from being a man who knew little or nothing of landscape gardening, has so perfected himself by study and observation as to need but an inspection of his work to establish the fact as to his knowledge of the art.

There is one thing which I have already called to the attention of your honorable body, and that is the removal of the fence around the settling-basin. It is a cheap picket fence and accomplishing no good whatever except to obstruct the view of the river front. If the Board would but consent to its removal, I think the members would be much surprised at the wonderful improvement that would be produced.

OIL AS FUEL.

In the latter part of 1892 we commenced burning oil. In 1891 and a part of 1892, natural gas was used, the contract being, however, to pay to the company what it would cost on the average with coal. Previous to that time coal was used exclusively.

The following table will give a pretty correct idea of the expense under the various fuels in use for the last six years. It will be seen that the rate per million in 1894 was 12 cents higher than 1893, which is owing entirely to the increased head that the engines are pumping against:

YEARS.	GALLONS	PUMPING EXPENSES.					Cost		
	PUMPED.	Fuel.		Labor		Total.		Gallons.	
1889	12,875,334,458	\$84,418	81	\$18,999	25	\$58,419	56	\$4 14	
1890	12,120,944,532	81,768	40	17,635	99	49,399	89	4 07	
1891	12,057,261,286	88,826	86	16,911	08	50,787	89	4 20	
1892	19,476,612,482	81,081	40	18,402	42	49,488	82	3 96	
1998	13,877,977,208	27,479	93	16,571	59	44,051	52	8 18	
	18,649,779,605	29,283	47	15.874	84	45,157	81	3 30	

Amount pumped in 1893, 13,877,977,208; multiplied by 96 cents, gives a total saving for the year of \$18,322.75.

The following statement shows the entire amount expended at the pumping station, including the original purchase of the land, the improvement thereof, the buildings, machinery, etc.:

ITEMS.	Previous! Expended	•	1894.	Total.

METER DEPARTMENT.

The Superintendent, Mr. Putnam, was placed by the Board in charge of Meters and Inspection in 1890. In 1893 I placed him in charge of the "Service Connections" Department, which includes a surveillance of all the work of plumbers. Last July I placed him in charge of the Repair Department, which afterwards was approved by you. Formerly it was under the Superintendent of Extension, who was obliged so often to be absent on the pipe lines when his services were needed in "repairs," that it became necessary to make a change. All of these duties, thus loaded upon him, have been performed excellently, and I have been saved much perplexity and annoyance which were previously my usual-diet.

METERS.

The introduction of meters still continues, there having been 722 new ones placed in 1894. The rapidity or volume of the introduction of meters each year has depended, and must still continue to depend, upon the amount of money that the Board could or will be able to spare from its resources. Further, that far from being considered an imposition, as it was the first year, applications for them come in now faster than they can be supplied.

The results are of interest. It is a well established fact in regard to water works, that construction and operation expenditures depend largely on the volume of water required to be pumped.

The following table will give some idea of the rapidly increasing pro rata consumption while there were practically no meters, and the results that have been obtained since.

HISTORICAL.*

The following table is one published last year, with the addition of the results of 1894:

YEARS, Families			WATER PUMPED.		
1 EARS.	Supplied.	Total Quantity.	Per Family.	REMARKS.	
1852	١ ا	285,840,275			
1853	4,283	303,531,743	70,868

1885		9,970,829,580	326,886		
1886		10,576,571,254	331,070		
1887		13,168,859,808	381,860		
1888		14,880,166,670	890.098		
1889	39,158	12,875,834,458	328,880	Commenced Meter-	
1890		12,120,944,532	292,300	ing.	
1891		12,057,261,236	274,470	···y.	
18 92 .		12,276,612,482	264,582	1	
1893		13.877.977.208	278,579		
1894		13,649,779,605	278,476		

It will be seen that the quantity pumped in 1894 is practically the same as that of 1887. The population of the city in

1887 was 184,829. The population in 1894 was 258,834, an increase of 74,000—a large city in itself. No innovation in the conduct of public affairs would be acceptable that does an injustice, nor should any attempt be tolerated in the interest of economy that saves for us, either individually or collectively. at the expense of the other interests. Ninety-five per cent. of those metered pay less than under the assessment plan, and while our receipts are thus reduced, at the same time the expenditures for operation and construction are so largely kept down as to more than double—yes, treble—the expense of the This statement is susceptible of proof, and as a part of such evidence I invite your attention to the following table. The third line and the last two lines are the important ones to consider in this connection. The two years previous to the introduction of meters are taken to show that 1888 was not an unusual year:

COMPARATIVE STATEMENT.

	1887.	1898.	1894.
Daily average consumption in gallons	86,079,068	39, 397, 716	87, 896, 606
Daily average consumption per capital	195	204	144
Total annual consumption	13,168,859,808	14,888,166,670	13,649,779,005
Total consumption through meters	65, 182,000	91,750,000	1,788,278,000
Revenue from unmetered water	\$316,316.30	\$385,140.10	\$344,877 👄
Revenue from metered water	\$6,518.20	\$9,175.00	\$78,661 07
Per 1,000 gallons metered water	. 10	.10	041
Per 1,000 gallons unmetered water	.094	083	.045
Number of families supplied	84,486	86,863	@,912
Number of service connections	31,938	86,609	47,430
Miles of pipe	322	895	676
Number of meters	About 40	48	3,165
Actual operating expenses	889, 728.74	\$02,402.54	\$65,065.22
*Estimated population	184,829	194,996	204,194

^{*} Population estimated by multiplying families in city by 5.14.

It is a very simple matter to take the first table and estimate what the amount of water would have been pumped had no restrictions to waste been adopted. The increase from year to year previous to 1889 was 8.5 per cent. Upon the supposition that this increase would have continued, which is reasonable, we would have pumped, in 1894, 31,732,901,624 gallons, or considerably more than double the quantity that was pumped, and an average daily supply of 86,939,453 gallons.

This seems rather wild, yet, when one looks at the column marked "Gallons per Family," and examines critically its sure and steady increase; and when one also sees the quantity pumped by Buffalo last year, which was a daily per capita of (*) 325 gallons, the per capita of which city was in 1888 considerably less than Detroit, which was that year 204 gallons, it becomes less problematical; in fact, as certain as any estimate could possibly be.

For the purpose of demonstrating how this has affected the water-rate payers as individuals, I call your attention to another table that is historical.

YEARS.	No. of Families Supplied.	Rates Received for all Purposes.	Average per Family.	REMARKS.
876	20,102	\$ 205,624 74	\$ 10 23)

891	43,933	389,079 97	8 85	Hose tax abated, tak
892	46,400	402,534 98	8 67	ing effect July 1st
803	49,817	420,490 83	8 44	Meter rates reduced
893	49,912	418,728 76	8 89	to 1/2 of a cent pe 100 gallons.

I hope this table will not be passed over with the usual glance that tables ordinarily receive. It proves conclusively several important facts. The first ten years' statements prove

^{*}See Water and Gas Review, January, 1895.

that, though rates are assessed upon and received from all classes of consumers in a city, if the schedule of rates remain the same, the rates divided by the number of families supplied will produce the same quotient; that is, the average per family will remain the same. The average for ten years preceding 1886 was \$10.21 per family.

Any reduction of rates and its effect on the income of the Board can be almost exactly measured by multiplying the number of families of the year by the average per family previous to the reduction. In 1886 the charge for household purposes for a private family was reduced from a sliding scale of \$5, \$6, \$7, etc., according to the number in the family, to the nominal sum of \$5.00. This took effect July 1, 1886. The average of the four years thereafter was \$9.36, or 85 cents less. Multiplying the number of families of any year by 85 cents will give the reduction of the income consequent. Families of 1890, 41,467; multiplying by 85 cents gives a reduction of income, \$35,246.95.

In 1891 the tax on hose for lawn and street sprinkling was abated, taking effect July 1st. At the same time the meter rates were reduced from 10 cents per 1,000 gallons to 6½ cents, then to 5 cents, and finally, October 1st of that year, to 3½ cents, where it now stands. The reductions of 1891, 1892, 1893 and 1894 are not due entirely to these changes of rates, as meters were being constantly placed, almost all of said consumers paying less than under the assessed rates. This can, however, be very closely calculated, as the hose reduction was, by a careful examination of the books, known at the time to be about \$20,000 per annum. We make, then, the reductions in income of 1894, as compared to the schedule of rates of 1885, as follows:

49,912×85 cents, gives reduction of rates for families	12,435 00
Abatement of hose	20,000.00
Leaving for reductions of meter rates, etc	28,449.00
A total of	90,878.00

This amount was saved to water-rate payers in 1894, and, proportionately, the same amount each year, and still the Board

continues to pay from its resources all expenditures for operation and construction, and a certain portion of its bonded indebtedness.

The last bonds issued by the Board was in 1881, since when it has redeemed from its resources \$519,000 of bonds. It has, however, received from the general tax levy in that time \$963,331.21, of which \$650,000 has gone to pay the interest upon the bond issue of 1873, leaving \$313,331 to assist in the payment of the \$519,000. In this time, therefore, \$205,668 of bonds have been paid from the ordinary resources of the Board, as well as the interest upon all bonded indebtedness outside the issue of 1873.

It is sometimes claimed that where all consumers are not metered it is prejudicial to those using them. This might be the case where the relationship between the assessment and meter rates are not carefully watched and adjusted, as they are in Detroit, so as to make them correspond. In a report from the Water Works of a certain city, I saw that one-fifth the water that was pumped passed through meters, and in another place in same report I saw that the meter rates received was one-half the total receipts. In other words, one-fifth of the consumers paid one-half the income. This is a common feature in the rates of different cities.

By the last table it will be seen that the receipts for metered water was $4\frac{1}{10}$ cents per thousand gallons, and that the receipts for unmetered water was $2\frac{1}{10}$ cents. It must be remembered, however, that the "unmetered" water includes all water that is lost by leaks in supply and distribution pipes, and all water consumed in public parks, by the Fire Department for ordinary consumption and also for fires. This, by careful estimates, is placed at fully 25 per cent. of the whole quantity. Deducting this quantity and dividing rates received by the remainder, we have for each thousand gallons nearly $3\frac{1}{10}$ cents, or one-fifth of a cent less than for metered water. This one-fifth of a cent per thousand gallons is calculated to be sufficient to pay for use and repairs of meters.

If there is anything that works prejudicial to one consumer

as against another, it certainly is the estimating or "guess" plan. In 1889, the placing of meters upon ten prominently large consumers developed the fact that they had been paying all the way from one cent per 1,000 gallons up to twenty cents. Two different manufacturers, engaged in the same business, one had been paying at the rate of one cent and the other at the rate of six and one-fourth cents.

Every meter that is put on, establishing the true quantity of water consumed, reduces the discrimination that has always existed under the assessment plan.

SCHEDULE OF RATES.

I have considered it my duty from time to time to recommend to your honorable body, which recommendations have always been adopted, certain reductions in the "meter" and "assessed" rates. In 1890 the meter rates were reduced to 34 cents per 1,000 gallons, because it was estimated that the cost of pumping, upon the basis of the operating expenses and the interest on the plant, was about 3 cents per thousand. reductions following, such as the abatement of the hose tax in 1891 and the subsequent change of rates last July, were made simply to maintain a proper relationship between the "meter" and "assessed" rates. The use of the term "free hose" is really a misnomer, as it is considered, or was when the reduction was made, that there was a sufficiently large assessment imposed for household purposes to pay for the water used in sprinkling lawns and streets. This reduction or abatement of charge for lawn and street sprinkling originated from a desire of the Board to reduce the "assessed" rates about \$25,000 per It found that the income from that source was larger in proportion than that from the supply of water through meters; and it also found that the above reduction in its income could be made to the benefit of the water-takers without injury to the works.

Previous to the making of this report, I had written to all of the cities having a population of over 80,000, and requested their meter rates From those who answered, I have prepared

the following table, that will give valuable information and will show that Detroit practically has the lowest meter rate in the world, with the exception of Washington, which is 3 cents per thousand. Washington water is supplied by gravity, and the construction expenditures to a large extent provided for by appropriations by Congress. Buffalo has but few meters; none where the consumption requires an annual payment less than \$50. It has also what may properly be considered as an aristocracy of prices, as indicated in the table:

					
CITIES.	ANNUAL PAY- MENT. CONSUMPTION 150,000 GALS. MONTHLY. MONTHLY.		Annual Pay- MENT. Consumption 8,500,000 Gals. Monthly.

7	Twelfth	8,069 6,190	5 9	8,074 6,109	915 443	- 13 - 39 6	18,0 58 43,5 8 6	- 8,970	177
	m		_						
ы	Eighth	8,15H 8,545	9 148	8,167 2,730	#3 1 141	8 92	21,986 14,718	- 1,180 - 449	334 54
	Totals	5, 703	194	5,897	225	19	36, 634	- 1,569	204
	egregate	49,912	445	50,357	8,734	95	\$381,504	- 80,944	\$7, 99

It will be seen by the foregoing table that there is a decrease of \$20,946 from the assessment of 1893.

This is caused, first, by assessments amounting to \$7,828 being taken from the rolls because of being metered.

The principal cause, however, was the reduction in the rates made by the Board April 11th, to take effect July 1st, which were as follows:

Additional closets to first, reduced from \$2.00 to \$1.00. Charge on stationary wash tubs of \$2.00, for private families, abated entirely.

Additional families over first family in same house and supplied through one faucet, to be reduced from \$5.00 to \$3.00.

By a careful inspection of the rolls, this reduction was estimated to be

On closets	\$4,200	00
On wash tubs	5,226	00
On families	10,812	00
Total	\$20,238	00

Upon the basis, therefore, of what was left on which to make assessments, there was really an increase of \$7,120.

The increase of 95 families shows that the city did not exactly stand still under the effects of hard times.

PORTY-THIRD ANNUAL REPORT OF THE

WATER WORKS BONDS.

To slowing table shows the whole history of the bonded to the Board, in which will be seen that the total at bonds issued is \$1,850,000, of which \$717,000 have redeemed, leaving outstanding \$1,133,000, upon there is an annual interest of \$69,070.

								\$1,850,000		\$717,000	£1,153,600

The \$50,000 of bonds "outstanding" of the imme of Aug. 1st, 1838, are collateral for loan due Feb. 7th, 1895, at which time it is the intention of the Board to retire them.

One hundred thousand dollars will be issued early in the year in accordance with a resolution of your honorable body Nov. 6th, 1894.

This issue is made necessary by the laying of a new force main from the pumping works, estimated to cost \$160,000.

In closing, I desire to commend the subordinate employes of the works, and particularly those engaged in the receiving of money, generally for their kind and considerate manner to water rate payers, and also for the willingness with which they have performed their arduous duties.

A position in the water office is usually regarded as "a soft snap," but if any one will spend a few hours, or days, in our "bee hive" and see the amount of work these officials perform, and the hours each day that they devote to it, the contrary fact will become very apparent.

All of which is respectfully submitted.

L. N. CASE,
General Superintendent and Secretary.

REPORT OF SUPERINTENDENT OF GATES.

DETROIT, January 2, 1895.

L. N. Case, Gen'l Superintendent and Secretary Detroit Water Works:

DEAR SIR—In compliance with your request, I respectfully present for your consideration my report of Gates examined and repaired, together with a statement of gate wells built and well covers adjusted to conform to a new pavement or grade, also repairs made to sewers that were necessarily cut into by the operations of pipe laying.

WELLS BUILT IN 1894.

106 by contractor Goodenow, \$1,584.82; covers, \$597.84\$3 445 by Detroit Water Works, (day work)	
551 wells. Total	
173 well covers adjusted and 19 sewers repaired\$	910 50

The well covers heretofore used are not adjustable to the grade of the street, only by adding to or removing the brick work of well, which is costly and annoying, as it is difficult to get to do it as promptly as we would wish. I therefore suggest that an adjustable well cover be used which would obviate the difficulty and expense, if one is found practicable. I have already designed a model of a cover which will, I think, answer the requirements, and which I have submitted to you for examination.

In this connection, however, I would respectfully recommend that in future wells be built only over gates that are in paved streets and out of order, as in unpaved streets the grade is not well established, or a deep ditch may be on each side, in which case an iron box will answer every requirement. While on the subject of gate wells, I would say that the examination of the large gates has disclosed the fact that many of the timbers covering the wells built over them are very much decayed and consequently unsafe. During the latter part of 1894, I removed the timbers and built brick arches over five of the worst ones, and as soon as the season opens for work in the spring, I would suggest that the remainder be put in good and safe condition.

About the middle of last August, I was ordered by you to examine all the gates in the system and to repair such as were out of order. As the operating of gates is one of the most serious and important duties to be performed in a water works, it was with considerable trepidation on my part that I undertook its performance. I sent out two gangs, one east and one west from Woodward avenue, both of them to work north from the river to the gates south of the upper 42-in. and 30-in. in Canfield, Calumet and Buchanan, and from Vinewood to St. Aubin avenues.

This somewhat extensive district apparently has lately received but little attention, so far as gates are concerned, as our examination disclosed a large number either broken, shut, or not conforming to the established uniformity as to size of head of spindle, etc. I therefore proceeded to repair them as fast as possible, as this district is densely built up, and in which there are a large number of wood-working establishments and lumber yards; but severe cold weather in November compelled a cessation of this work, as the ground was soon frozen to a depth of 18 or 20 inches, but we are at the present time repairing gates that are in wells, and cleaning the snow and ice from over the main gates.

Below please find a statement of gates that have been examined, repaired, etc., up to Dec. 31st.

Whole number examined and tested		2,689
In good order		
In good order, but shut	123	
Broken and shut	171	
In bad order	257	2.689

Opened	128	
Repaired and opened		
Repaired		
To be repaired	88	
In good order	2,138	2,689

Discontinued 8 gates and set 2 new ones.

These have been reported to the Extension and Engineering Departments.

Our work, examining gates, discloses a large percentage of decayed wood boxes, and some iron ones that are filled with sticks, stones, etc., or not up to grade.

To be able to work a gate properly, it is imperative the box should be clear, and to clean them out the box must be dug up. What has been done in this will be found below.

Decayed wood boxes	107
Iron boxes filled up	
Wood boxes replaced with iron	
Iron boxes cleaned out	
Iron boxes set to grade	
Cost—labor, gates and boxes	24

All of which is respectfully submitted,

JOHN BRIDGE.

REPORT OF THE CIVIL ENGINEER.

January 26, 1895.

To the Honorable Board of Water Commissioners of the City of Detroit:

GENTLEMEN—In conformity with the regulations governing this Department, the Civil Engineer presents for your consideration the following annual report:

The work of the year just past has been so intimately connected with that of .1893 that the two must be, in a measure, considered together. While it is the province of the various heads of departments to consider parts of our system, the Civil Engineer has to deal with it in its entirety.

Scientifically, our system is regarded as a machine, of which the intake conduits, the boilers, the engines, the distribution system, the fire hydrants, even the plumbing and fixtures in the buildings of our consumers are but parts of a complete whole. The purpose of every machine is to do work or to transform energy. Our machine changes the latent powers of the fuel to the active forces of the jets of water that flow from our penstocks. In every machine there are certain losses of operation which render it impossible to get back as much energy as is put in, and it is the effort of the designer to reduce these losses to as small an amount as possible. The quotient obtained in dividing the work extracted by that put into a machine is called its efficiency.

The theoretically perfect machine would be so adjusted that every part should work with its maximum efficiency at the same time. In practice, it often happens that this is impossible, and in water works construction especially we frequently find that when one part of the machine is affording maximum economy, another part may be working at its worst. For every machine, simple or complex, there will be certain conditions of

operation which will produce maximum efficiency, and any variation from these conditions will result in diminished economy. The work of machines is usually measured by the foot-pound, which is the amount of energy expended in raising one pound of matter one foot high against the force of gravity. The losses in a water works system may be classed under two heads: losses due to overcoming the elevations of the territory supplied, and losses due to frictional resistances in the pipes. The former will change only with the quantity of water elevated, while the latter will also be affected by the velocity of flow. In our system, during the past year, less than one-half of the work done by the engines was delivered to the consumers in a form to be utilized. Of the quantity lost, which ranged from about 45 per cent. to 65 per cent. of the whole, a nearly constant portion, averaging about 86 per cent. of the whole, was used in overcoming the elevations of the system, while the remainder, averaging 16 per cent, of the whole, was consumed by friction. As we cannot change the location of the city, the work expended in the former case cannot be reduced, except by lessening the consumption of water, but the losses due to the latter cause may be decreased within certain limits, by proper modifications and manipulations of the distribution system, though they can never be wholly eliminated.

In order to thoroughly understand the investigations embodied in this report, it is necessary that the sources of the information and the method of utilizing it be explained. To begin with, the work that our engines have to do is to take the water from the level of its surface in the pump wells and elevate the necessary quantity to such a height, or give to it such a pressure, as will enable it to flow to the points at which it is consumed, and have remaining a sufficient head or pressure for the purposes of its use. At the engines an hourly record is kept of the quantity of water pumped—measured by piston displacement—and of the pressure pumped against. When these quantities are multiplied together, the product measures the work done by the engines. It is therefore seen that increasing either the pressure pumped against or the quantity

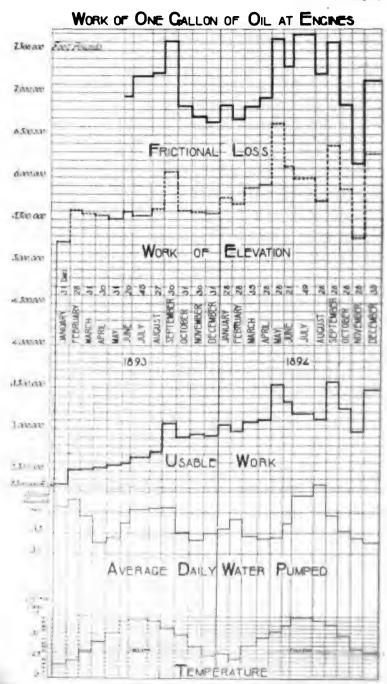

pumped increases the work, and that as much work is required to pump one million gallons of water against fifty pounds pressure as to pump two million gallons against twenty-five pounds pressure. There is also kept a record of the quantity of fuel consumed, and by dividing the work done as deduced above by the number of gallons of oil burned, the work per gallon of oil is obtained. From this it may be determined which engine or which boilers or what method of burning gives the best results.

For the purpose of obtaining the amount of work that our system is delivering to the consumers, as well as to have notice of any localities deficient in pressure, there have been established at various points about our system, mainly in fireengine houses, pressure gauges connected to our mains, from which readings are recorded every hour. Each gauge is then taken as representing a district, whose area is determined by the topography and the arrangement of our mains. If now the pressure on each gauge be multiplied by the area of its district, and the sum of the products so obtained be divided by the sum of the areas, the result will be an average pressure for the city. The locations of the several gauges are shown by the double circles on the map opposite page 52. investigations for want of a more accurate basis of computation it has been assumed that the consumption of water is uniform throughout the area of our city. Owing to the situation of our pumping plant with reference to the center of the system, from which it appears that about the same quantity of water will be consumed between the works and the place of maximum consumption, as will be consumed beyond the latter point, and because the distance from the engines to the center of the district of maximum consumption is very nearly a mean between the distances to the centers of the districts east and west of it, the above assumption may be shown to be reasonably accurate as regards total or average results. assumption, if now the quantity of water pumped be multiplied by the average pressure above obtained, the product will be the Usable Work of the system, or that which may be utilized

for the purposes of the consumer. Further, if the elevation of each gauge above the river be multiplied by the area of its district and the sum of these products be divided by the sum of the areas, the quotient will be the mean or average elevation of the system; and when the quantity of water pumped is multiplied by this mean elevation, the product is the Work of Elevation. If, from the total work of the engines, the sum of the Usable Work and the Work of Elevation be subtracted, the remainder will be the work expended in overcoming frictional resistances. In making the computations for the data herein, the work of the engines has been figured for two periods each day, and these results together with the gauge readings have been averaged by weeks.

Turning now to Plate I, page 42, the area included between the top irregular line and the bottom of the plate represents the work of the engines for the periods indicated near the middle of the plate. The area between the same line and the broken line below it, represents the work of overcoming The area between this broken line and the full jagged line next below, represents the work of elevation. The area between this last jagged line and the bottom of the plate, represents the usable work, all upon the basis of the work of one gallon of oil. The lowest irregular line of the plate shows the mean temperature, and the irregular line next above gives the average number of gallons of water consumed daily. Considering now the first mentioned line, the ordinates to it from the base of the diagram give the average daily work of one gallon of oil at the engines for the various periods. This line, it will be noted, begins June 1, 1893; previous to that time no continuous record of the head pumped against at the engines was kept, hence it is impossible to carry the line back of that point. The first manipulations leading to the readjustment of the distribution under the direction of your Engineer took place in March, 1893, and as described in the Report of last year resulted in a slight improvement in the condition of No further changes were made until June 20th following, so that the record of the first twenty days of June

may be taken as a fair representative of the period preceding. It is seen at once by the rise in the top line that after the latter readjustment, the work performed by each gallon of oil was materially increased, This increase continued through August, and in September there is a still further increase, which is to be accounted for by the fact that two engines were run at full capacity during the night for most of the month, and the excess water so pumped was wasted into the well. Experiments since that time indicate that the probable amount of water so wasted was between one and two million gallons each night. In October, owing to the decreasing consumption and the colder weather, which latter required the use of oil for heating, the work began to decrease and continued so to do for the same reasons, until the close of the year. About the first of January, 1894, the pressure was increased on the down-town system, and this, together with a slight rise of temperature, as shown by the bottom line of the diagram, accounts in a measure for the increased work of the oil in that month. February, extremely cold weather again lowered the line, which the warmer temperature of March raised to and above the former point. The same cause accounts for the gain in April, and in May a slight increase in pressure and the running of the new engine combined to produce a marked favorable effect. In June, although the quantity of water pumped considerably increased, the fact that Engine No. 4, the new engine, did not run, and other undetermined causes, reduced the work of the oil. July was the banner month at the pumping station. The quantity of water consumed required the running of the engines much of the time at their most economical rates, and the same conditions seem to have held in August, so that the drop in the line for the latter month appears to be one of those occurrences so frequently met with in experimental work which seem to baffle explanation. part of the difference may be explained by the fact that Engine No. 4 ran in July a portion of the time and not at all in August, but beyond this no reason is apparent. In September, Engine No. 4. again ran and a more even demand for

water assisted in bringing the efficiency to near its maximum. Cooler weather and a decreasing consumption, causing the engines to be run at less economical rates, together with the idleness of Engine No. 4 during most of both months combined to lower the line by successive steps in October and November. The working of the new engine, which ran more than thirty days out of the thirty-five credited to December, accounts for the increased economy with which the year closed.

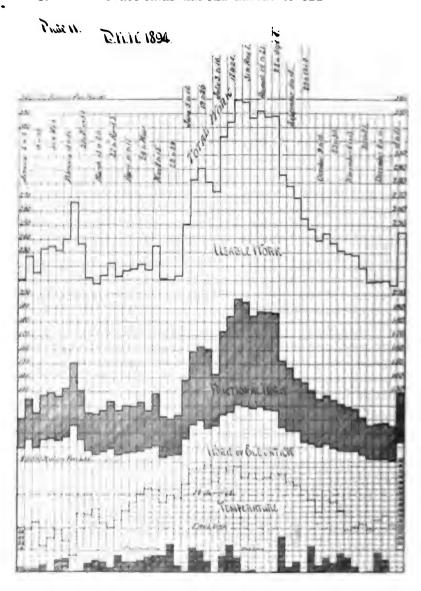

From the foregoing it appears that the running of Engine No. 4 tends to greatly reduce the fuel bill. A closer examination of the records shows that when two engines are running and doing equal amounts of work, if Engine No. 4 is one of them, the fuel consumed is nearly 20 per cent. less than when it is not. This means that if all our engines were as economical as the new one, our fuel bills would be only about 60 per cent. of what they are at present. The cost of fuel for 1894 was \$29,283.00. During the year Engine No. 4 has run less than one-fourth of the time. If, while running, it caused a saving of 20 per cent, the total saving due to it would be 5 per cent. of the year's fuel, so that if it had not run at all the fuel bill would have been over \$30,000.00. A saving of 40 per cent. of this would amount to \$12,000.00, which at 4 per cent. is the interest on \$300.000.00. This sum would be just about sufficient to replace the three old engines and their boilers, and if this were done the saving in fuel would pay the interest on the investment, leaving the proceeds of the sale of the old machinery as clear gain. It will be noted, however, that during the greater part of the year one engine, in addition to the new one, is sufficient for the demand. Such an additional engine could be obtained and housed for about \$125,000.00. interest on this at 4 per cent, would be \$5,000.00. By such an arrangement a saving in fuel of about \$10,000.00 per year would be effected, leaving a net gain of \$5,000.00 per year after the interest on the investment is paid to apply on the cost.

Referring again to Plate I, page 42, the ordinates to the full irregular line about the middle of the diagram, measured

from the bottom of the plate represent the average daily Usable Work of one gallon of oil at the indicated periods, beginning with January, 1893. It will be noted that there is an abrupt increase in this work in February, the cause of which is not wholly apparent from the information at hand. From February to August there is a steady gain in the work of the oil. due partially to the warmer weather and to the manipulations of the system in March and June before mentioned, as well as to some changes in the methods of burning the oil. In August the rise is to be accounted for largely, if not wholly, by the completion of the Michigan avenue twenty-four-inch line. The record for September, from the explanations previously given, is erroneous as to the Usable Work, for a part of the water figured as used was in reality wasted at the engines, and if a correction were made for this it would bring the line for the month to about the same position as that of the month preceding, which would be in entire harmony with other The October line shows an increase in the Usable Work over August, due to the completion of the Park street extension, and the fact that less water being pumped, the frictional losses were less, and consequently the pressure on the distribution, though not on the engines, was increased. In November the decreasing friction tended to more than compensate for the colder weather and reduced pumping, and the line rises above that of October. It will here be noted, that while the Usable Work of the system per gallon of oil has increased, the work at the engines has decreased. This is due to the decrease in frictional resistances. The increasing colder weather in December caused the line of Usable Work to fall with that of the work of the engines. In January, February, March, April and Mav. 1894, the fluctuations in the lower line are but the reflections of those of the upper line. In June increasing consumption increased the friction, and hence reduced the head over the city, so that the Usable Work was decreased for the month, and atill further fell in July and August, when the maximum quantity of water was pumped. It is worthy of notice, that while the work of the oil at the engines was not materially

greater in June and July, 1894, than in the same months of 1893, the Usable Work shows a very decided increase which can only be accounted for by the improvement of the distribution September, October, November and December, on account of decreasing consumption and reduced friction, show gains in the Usable Work, and close the year with an increase of 48 per cent. since the beginning of 1893. Comparing June. '94, with June, '93, there appears an increase in the Usable Work per gallon of oil consumed of 28 per cent., of which 5 per cent. was at the engines, and 23 per cent. in the distribution. Comparing December, '94, with December, '93, there is a gain of 18 per cent., of which 7 per cent, was at the engines, and 11 per cent, in the distribution. Again, comparing the system at times of maximum consumption, July, '94, and July, '93, shows an increase of over 19 per cent., of which 7 per cent. is at the engines and 12 per cent. in the distribution system. Now, comparing the frictional areas for the several months of 1894 with those of 1893, it will be seen, that in every case, except July, the friction has been decreased, and that it was not decreased in July was due to the enormous quantity of water forced through our system during that month. The entire work of the system, by weeks, for 1894, is shown by Plate II, These results reflect great credit upon the management at the pumping station, and had it not been for the cordial co-operation of the Chief Engineer such satisfactory ones could not have been obtained.

The operations which have led to these improvements in our distribution system were partially described in the Report of last year. The continuation of the work this year has embraced the curing of about one hundred and fifty pre-existing dead ends, the making of over thirty connections between mains previously crossing, but not connected, the laying of a sixteen-inch cross-town line, with ten-inch and eight-inch branches in the northern part of the city, and a twelve and ten-inch line, with eight-inch branches connecting the Mullett street and the Watson street mains; all of which construction, including that of 1893, except the connections, and mains less

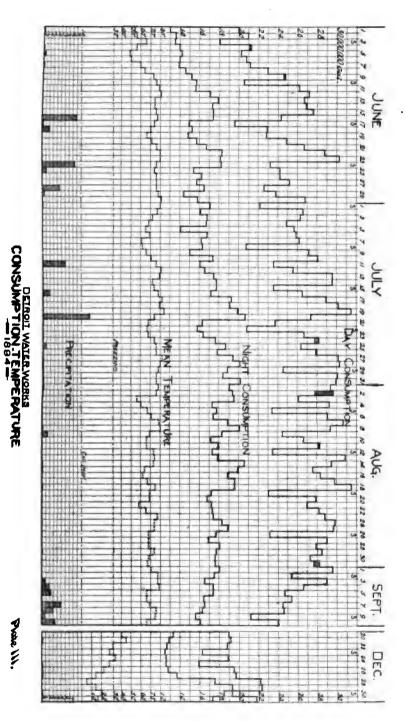

than eight inches in size, is shown by broken lines on the map opposite page 52. There has further been completed, during the year, under your Engineer's supervision the laying of the ten-inch main for the supply of Belle Isle Park, the laying of

an eight and six-inch extension in the township of Grosse Pointe, to the grounds of the Detroit Driving Club, and beyond to the Marshland road, and in the township of Hamtranck, a six-inch extension on the Norris Plank Road to Forest Lawn Cemetery. Some changes in the strainers of the intake conduits, and in the strainer wells at the pumping station, as well as some alterations in the suction conduit of the new engine, were also, in part, carried on under his direction, all of which come more properly in the reports of other departments.

An investigation into the conditions of flow in our distribution, demonstrated that, at the period of minimum consumption, the average head expended in overcoming the frictional resistances of the entire system was a little less than eight per cent. of the whole head pumped against, and at times of maximum draught this was increased to thirty per cent., while the average for the year has been about sixteen per cent. this, in all cases, two-thirds is lost in that part of the system east of Mt. Elliott avenue. The frictional loss between the engines and Mt. Elliott avenue is greater than that from Mt. Elliott avenue to the intersection of Grand River avenue and Sixteenth street. The existence of these conditions, together with the fact that if one of the two forty-two-inch mains now conveying the water to the city should be disabled, the other would be inadequate to protect the city in case of fire, or even to supply the full domestic requirements, led to the recommendation of an additional force-main from the pumping station, which is to unite with the present system at the intersection of Champlain and Chene streets, thus providing for a stronger flow of water through the Mullett street thirty-inch main and its branches in the district midway between the former upper and lower mains. Owing to the demands for increased pressure in the business portions of the city, the former low service has been practically done away with east of Sixth street, so that no gates are now kept closed in the system except those along the 130-foot contour line running northwest from the intersection of Bagg and Sixth streets, as shown on the map opposite page 52.

We now come to the consideration of the water consumed. This at some periods of the year is very intimately affected by the temperature, and also at certain times by the amount of moisture precipitated from the atmosphere. While during the spring and fall the effect of the temperature is insignificant, it becomes more noticeable when the mercury rises above 55 deg. Fahr., or falls below the freezing point. In the former case the consumption is increased by lawn and street sprinkling. and in the latter by consumers leaving the fixtures open in order that the water may be kept in motion and thereby prevented from freezing in the service pipes. During the cold weather, as might be expected, the precipitation has no very apparent effect on the consumption, but during the hot months a rain or hail storm will very materially decrease it. To consider these effects more closely, refer to Plate III, page 49, in which the ordinates measured from the base of the diagram to the top line show the quantity of water consumed during the twelve hours from 7 A. M. to 7 P. M., and ordinates to the second line represent the consumption during the twelve hours of the night preceding. The lowest irregular line gives the mean daily temperature, and the small cross-hatched areas at the bottom show the amount of precipitation. Following the lines of consumption on the plate and neglecting Sundays which are marked S, it is seen that the fluctuations of the day and night consumption follow very closely the variations of temperature. The effect of rain may be especially noted on June 16, July 10 and 20, August 9 and September 3 to 9, in all of which cases the change of temperature was slight. A consideration of the effect of the storm on July 20 gives an idea of the quantity of water that may be used for sprinkling and like purposes. The difference in consumption between Thursday, July 19, and Saturday, July 21, due almost entirely to the storm of July 20, and resulting fall of temperature, was nearly eleven million gallons. As a rain would not be likely to affect any other consumption than that for lawn and street sprinkling and cooling purposes this quantity must be very nearly the amount so used. Eleven million gallons is nearly half the daily capacity of the

new engine, is more than one-third of the entire average daily consumption during some of the spring and fall months, is nearly one-ninth of our entire pumping capacity, and is equal to the entire average daily consumption that would be required for an investic and manufacturing purposes if there were no waste.

The effect of cold weather is shown at the extreme right of the dayram where comparing the consumption of Saturday, Dec. 22, when the mean temperature was just at freezing, and that of the Saturday following when the mercury averaged about 13 degrees above zero, Fahr., we find a difference of ten million gallons in the consumption of the twenty-four hours. There is this distinction between these two excesses: the former is mainly added to the day consumption when the system is most severely taxed, while the latter principally affects the demand during the night when there is pumping capacity to spare and so is the less significant in its effect upon the operation.

The small cross-hatched areas along the line of daily consumption in Plate III represent the quantity of water supplied by our works for fire extinguishing. The largest quantity is that used on August 2, when occurred the Richards' Mill fire and a fire in the Michigan Central flour sheds, requiring the services of eight and five engines respectively; the total amount used in these two fires being about two million gallons.

The variations in the yearly consumption by seasons are shown in Plate IV, Figs. 1 and 2, page 51. In Fig. 1, ordinates measured from the base of the diagram to the upper irregular line represent the hourly consumption of water during the week of maximum demand, that beginning July 24; the ordinates to the lower irregular line represent the hourly supply during the week of minimum demand in the spring. In Fig. 2 the upper irregular line gives the hourly consumption during the week of maximum usage in the winter, and the lower line that for the minimum week of the year, beginning Dec. 18. From these diagrams it is seen at once that the maximum hourly consumption in the summer is a little more than twice the minimum in the same season, and that in the spring and

51

fall the former is slightly less than two times the latter, wh during the winter, the minimum may rise to three-fourths the maximum.

From the fact that the hourly consumption between and four o'clock in the morning averages half as much as greatest hourly quantity used in the day for three-fourthe the year, and in those seasons when there is no especial real for night usage, it is very evident that there must constant be a vast quantity of water running to waste from our syste either through defective construction, or the carelessness of consumers, or both. Just what this waste really amounts can only be approximated, but the fact stands, that also 900,000 gallons is the least quantity registered in one how during the past two years.

The per capita consumption for the year 1894 has falk below that of last year, and, on the basis of the number consumers, is less than that of 1892, and is therefore at the lowest point reached since Detroit attained the unenvisb distinction of wasting more water per inhabitant than as other large city in the world. The causes of the decrea from last year's consumption are to be found very largely the milder winter of 1894, and in the introduction, by the Chief Engineer at the Pumping Station, of a device for avoid ing the necessity of wasting water at the engines at thos times when two engines pump too much, and one engine no enough, for the demand. The consumption for January February and March, 1893, exceeded that of the same months for 1894 by over four hundred and forty million gal The saving at the engines appears to have average about a million gallons a day for half of the year. The con bined effect of these causes, amounting to a per capita reduce! tion of about six gallons per day, was in part counteracted by the extremely hot and dry weather of July and August, so that the reduction in the daily consumption is, as elsewhere shown, only about four gallons per inhabitant.

The work of the Draughting Room during the year has added greatly to the utility of the records of our system.

THE NEW Y

fall the former is slightly less than two times the latter, wh during the winter, the minimum may rise to three-fourths the maximum.

From the fact that the hourly consumption between and four o'clock in the morning averages half as much as greatest hourly quantity used in the day for three-fourths the year, and in those seasons when there is no especial rea for night usage, it is very evident that there must constant be a vast quantity of water running to waste from our systeither through defective construction, or the carelessness of consumers, or both. Just what this waste really amount can only be approximated, but the fact stands, that all 900,000 gallons is the least quantity registered in one he during the past two years.

The per capita consumption for the year 1894 has fall below that of last year, and, on the basis of the number consumers, is less than that of 1892, and is therefore at lowest point reached since Detroit attained the unenvision distinction of wasting more water per inhabitant than other large city in the world. The causes of the decree from last year's consumption are to be found very largely the milder winter of 1894, and in the introduction, by Chief Engineer at the Pumping Station, of a device for avoi ing the necessity of wasting water at the engines at the times when two engines pump too much, and one engine enough, for the demand. The consumption for January February and March, 1893, exceeded that of the sa months for 1894 by over four hundred and forty million The saving at the engines appears to have average about a million gallons a day for half of the year. bined effect of these causes, amounting to a per capita red tion of about six gallons per day, was in part counteract by the extremely hot and dry weather of July and August, that the reduction in the daily consumption is, as elsewhe shown, only about four gallons per inhabitant.

The work of the Draughting Room during the year hadded greatly to the utility of the records of our system

THE MBW I

HING NEW YORK

THE PARTY ON A POST ON A POST ON A POST ON A POST ON A POST OF A P

About one-half of the city is now mapped, nearly two thousand drawings having been added during the year, making a total of over three thousand street intersections platted and bound for reference. Besides this, the office has furnished working plans and drawings of "shut offs" for the laying of nearly forty miles of pipe during the season. The force has consisted of the Chief Draughtsman and three assistants, one of whom has been employed nearly the entire time correcting our own and the assessor's maps. The many errors and omissions found in the field notes and foremen's reports of previous construction, has led recently to the transfer to this Department of the keeping of all such records, and a marked improvement is already noticeable. The record of pipeage, as published at the end of this report, has been considerably rearranged since last year. Pipe in east and west alleys is now to be looked for under the heading of the street next north, and pipe in north and south alleys west of Woodward avenue will be found with the street next east, while in those east of Woodward avenue it will be found with the street next west; hence, the alleys adjacent to Woodward avenue will be found with that street. A very few exceptions, and only in cases of diagonal streets, have been made to the above rule. The Boulevard pipeage should now be looked for under the head of the street with which the portion in question is in line; and, finally, all pipeage is read from west to east, or from south to north.

In closing this report, it is pleasing to testify to the cordial and hearty co-operation that has been tendered me by all my associates. Thanks are due to the officer in charge of the local station of the United States Weather Bureau, and to the several City Departments, for many courtesies and valuable information during the past year.

All of which is, gentlemen, very respectfully submitted.

G. S. WILLIAMS,

Civil Engineer.

REPORT OF SUPERINTENDENT OF METERS AND INSPECTION.

DETROIT, January 2, 1895.

To the Board of Water Commissioners:

GENTLEMEN—In compliance with the rules and regulations of your honorable body, I herewith report the work done in the Meter, Inspection, Service Cocks and Repairing Leaks Departments during the year 1894.

The following tables show the number of meters placed, the number removed, and the total number in service Desember 31st, 1894:

Placed in 1891.

Six hundred and seven meters have been placed during the past year, and 412 of them at the request of the consumer, showing that the meter is being looked upon at the present time with much favor, rather than with fear and distrust as was the case when they were first introduced, and they certainly will continue to increase in favor as the benefits derived from their use, both to the consumer and the water department, becomes more generally known.

We have now a total of 3,186 meters in service, and are deriving the same satisfactory results as in former years. They are the greatest "leak detectors" known to-day, and it requires no effort on our part to have leaks repaired on metered

connections, as the consumer is only too glad to have an opportunity of reducing his water bill when he knows how to accomplish it.

In metering the public buildings, hospitals, charitable institutions, etc., during the past season, we have found the source of an immense consumption of water, and without doubt a large proportion of it is needless waste. For instance, the consumption at the City Hall is 2,433,560 gallens per month, or nearly 3,000 barrels per day. The Eastern and Western markets consume 1,500,000 gallons per month, an amount that would seem to be far in excess of any reasonable demand. one of the school buildings the meter showed a consumption of 2,112,000 gallons the first month it was in service, and the same school consumed only 435,500 gallons last month, showing a reduction of 1,676,500 gallons, the effect of paying by meter messurement. There are 54 school buildings metered. and although the reduction has not been in the same proportion in every instance, still it has been large. There are a few still where the consumption seems to be far beyond any reason therefor. The High School, for instance, 1,800,000 gallons, Houghton School, 1,225,000, and Tappan School, 1,500,000 gallons monthly, at least four times as much as there is any possible necessity of using.

The consumption in the different hospitals is enormous in comparison with what they should use legitimately. Take the "Harper," for an illustration, an institution containing, on an average, 150 persons, and their consumption the first month after placing meter, was 2,812,500 gallons, which is a daily per capita consumption of 625 gallons, and at the regular rate would amount to over \$1,100 per annum, being more than the Water Works receive from all the charitable institutions in the city. If the balance of the city—with the free and unrestricted use of water, should use it in the same proportion—estimating the population at 250,000—there would have to be pumped into the mains daily, 156,250,000 gallons for family purposes alone, and to that would have to be added the amount used in stores, factories, livery stables, saloons, breweries,

etc., which would be very nearly as much more (as experience has shown such places have been the most reckless in the waste of water), making upwards of 300,000,000 gallons daily, or about three times the capacity of the present works. Their daily per capita rate in December was 447 gallons, a per capita reduction of 78 gallons. Grace Hospital, with an average number of 135 persons, during 26 days in November, used 1,925,250 gallons, being 548 gallons per day for each person. Their per capita rate in December was 491 gallons, being a reduction of 57 gallons.

The city pays \$1,000 per year for all water used for charitable purposes, an amount that was fixed several years ago, when such institutions were less numerous, and not nearly so pretentious as many of them are at present, and as the most of them are not altogether charitable, I should think the Water Works should receive an amount equal to the cost of furnishing the water, whether the city or the institutions themselves pay for it, but in any event, there should be a limit to their consumption, and the only practicable way that I can see to arrive at it, is to have a stated price for a stated quantity; let the price be the smallest consistent amount, but whatever it is, it will have a tendency to stop the waste, as there will then be an incentive to look after the leakage. Without something of the kind is done, the extravagant consumption will still continue.

The meter has demonstrated that the enormous use of water in many of the public and charitable institutions is largely in excess of their legitimate uses or necessities, and it seems as though on such places as your honorable body furnish water without charge, the quantity should be limited to a reasonable allowance, and all over that to be paid for at the regular rates. It could be arrived at by comparing their consumption during the time the meter was in position and when the occupants were supposed or expected to pay for the amount consumed; said consumption would probably be about what they ought to use legitimately, which is much less than what it has been since they have understood that the water

would be furnished without charge. For instance, why should Mt. Elliott Cemetery consume 204,750 gallons in October and 572,250 in December? If they were obliged to pay for all they used over 200,000 gallons monthly (which is an exorbitant quantity), they would probably confine their consumption to that amount, and by so doing, the Water Works would save 272,000 gallons per month in this one instance alone. Elmwood Cemetery consumed 1,223,250 gallons in November, and very nearly 1,000,000 gallons in December, the necessities of which I am unable to explain.

Police headquarters consumed 262,500 gallons in July and 448,500 gallons in October, and 421,500 gallons in November. The only explanation for the large increase since July is the fact that then they had to pay for the water, and since that time it has been free.

The Elmwood Ave. police station consumed 108,750 gallons in July and 214,500 gallons in December, very nearly double, when from the very nature of things, it should have been much less in December, than it was in July. All of which proves, that to stop waste effectually, there must be a charge for the quantity consumed, which never fails to produce the desired results.

The works are still pumping about 140 gallons daily per capita. On metered premises—that is private families with all modern fixtures such as baths, closets, etc.—the average quantity consumed daily per capita is about 50 gallons, that is on single houses, and in modern flats where from eight to twenty-four families take water through one meter, the consumption is only 40 gallons. Tenement houses where there are no fixtures except the ordinary hydrant, the consumption is 17 gallons, so that for family use the quantity pumped ought not to exceed on an average over 36 gallons daily per capita. Basing our population at 250,000, it shows that 9,000,000 gallons daily would supply the city for family purposes, were the waste reduced to a minimum. Very nearly all of the business places are metered, and as they show a consumption of about 5,000,000 gallons daily, to which may be added 1,000,000 gallons for

small stores, factories, etc., not metered, it appears that about 16,000,000 gallons would be a fair estimate for the daily supply of the city, instead of from 31,000,000 to 52,000,000 gallons, as we have been pumping.

The resolution passed by your honorable body allowing hose connections placed outside of the meter, so that lawn sprinkling should be free, as is the case with unmetered water, is causing some friction. In some cases the lawn is hardly large enough to be called by that name, and at the same time is situated behind the house, or on the side, where by attaching a hose it can be taken into the barn for carriage washing and all uses about the premises, such as flushing closets, washing windows, etc. While the majority will be perfectly honest, and use it for lawn purposes only, there are some who think that public property is legitimate picking, and do not hesitate or allow their conscience to prevent them from keeping their meter bills at the minimum amount each month.

The expense for the care of meters increases in proportion to the number in service. One thing that has caused us much trouble has been the changing of the street mains in different localities from smaller to larger ones. The water being shut off in the main pipes changes the current in the locality in which they are operating, sending it in a different direction, thereby stirring up the sediment in the pipe which is drawn into the service connections, and not only stopping the meter, but often the whole service pipe is filled with it. By the use of the large "Smith-Topping Machine" purchased last season, many of the connections can now be made under pressure, and the above difficulty will be obviated to a large extent. Another cause of trouble has been the hemp packing that has been allowed to get into the pipes while the joints were being calked. It has been the means of shutting off the supply of water on many metered and unmetered service connections, which has caused much annoyance and expense in removing it. of our wooden wells that were built five or six years ago are beginning to decay, and where they are outside of the lot line, we are obliged to replace them with brick, as the Board of

Public Works will not allow any more wood put in. It costs a little more to use brick, but in the end it will have been a good investment, as they will require no further attention for many years. At present, nearly all meters are placed at the request of the consumer, and he is obliged to build the well in case one is necessary, so that in the future our only expense for wells will be to replace those we have already built, and at a time when we had to force the placing of the meter.

INSPECTION.

The five leak examiners have made 55,603 examinations during the last year, and reported 4,163 leaks, 3,890 of which were repaired within the time given for same, and 273 were ordered shut off for failure to make the necessary repairs.

The percentage of leaks to number of examinations made was 7.48, being a slight reduction compared with the year 1893, when it was 7.77 per cent.

In many places the water is found running continually, for which different excuses are given; at this season of the year the principal one is to prevent freezing, something that it seems almost impossible to prevent by any other means than a meter, for although fair promises are made to the examiner to prevent him ordering the water shut off, the moment his back is turned the water is running again in the majority of cases.

The increased pressure on the mains has caused many leaks, owing largely to old and worn out service pipes which have been in the ground for many years. Being of a lighter grade than what is being used at the present time, they are giving away under the increased pressure, and it will probably be a source of considerable trouble for some time to come, as there are many of the old connections which will have to be replaced with stronger service pipes in the near future, especially so, if there is any further increase of pressure.

Where leaks are discovered, the occupant is given a stated time to make the necessary repairs, and at the expiration of the time the premises are examined again. If repairs are not made, the water is ordered shut off, unless there is some good reason for not doing so. In most cases, however, the repairs are promptly made, as will be seen by the small number ordered shut off, the percentage being 6½ of the whele number of leaks reported.

In addition to the foregoing work, the examiners read about 2,700 meters each month, and deliver all of the meter bills, with the exception of a few in the outskirts of the city, which are delivered by the service cocks inspectors.

SERVICE CONNECTIONS.

Two thousand and sixty-seven service connections have been made during the past year, consisting of 1,327 \(\frac{5}{8} \)-inch, 693 1-inch, 21 2-inch, 12 3-inch, 12 4-inch, 1 6-inch, and 1 10-inch, which added to those previously inserted makes a total of 47,559 service connections in the city on January 1, 1895. In addition to the above we have inserted 939 \(\frac{5}{2} \)-inch and 485 1-inch service cocks for the Iron Pipe Department on streets where the old mains have been discontinued and larger ones put in their places. In such cases we have been obliged to connect all of the old service pipes to the new mains, making a total of 1,424 service cocks inserted for the Iron Pipe Department.

All service cocks are now inserted with the Muehler tapping machines which were purchased in 1893, the necessities for which were fully explained in my last annual report. These machines insert the cock with a screw or thread, and with their use the old drive cock has been entirely abandoned. We were under the impression that the "drive cocks" were a source of large waste, as such a large percentage of them were supposed to be leaking, but upon examination of several of the old mains that were exposed during the past season, preparatory to changing them, and while they were under pressure, the writer examined many of the connections and was surprised to find so few of them leaking; and on keeping a record from July 12 to August 30, we find that there were 462 old service cocks taken out, only three of which were leaking, a little over six-tenths of one per cent. However the Muehler cock is

a great improvement over the other, as there is no possibility of them being blown out with an increase of pressure or from any other cause whatever.

There have been one 2-inch, three 4-inch, one 6-inch and one 10-inch service connections made for as many different manufacturing institutions to furnish water for automatic fire sprinklers, and there being no charge for water used for fire purposes, acting under instructions from the General Superintendent, I have required the parties making such connection to sign an agreement wherein said service is to be kept separate and independent, to be used for fire purposes only, and that no connection shall be taken therefrom for any other purpose whatever, and also to permit a thorough inspection of the system by the Water Board or its employes whenever it so desires. We have nineteen such connections on premises where their regular supply is metered and taken from a separate service, and in making examinations at different times we have only found one instance where the fire service had been tapped to get water that did not pass through the meter; the proprietor however claimed that it was done innocently by their engineer, who was not familiar with the premises, or with the agreement they had signed, and I have no reason to doubt that such was a fact. Nevertheless, as the "automatic fire sprinkler" is getting to be quite popular, it is something that will demand considerable attention in the future.

We still derive the same satisfactory results from the use of the "Smith Tapping Machine" for making large connections under pressure. The largest connection we have made thus far was a 10-inch on the 42-inch main for an automatic fire sprinkler put in by the Detroit Stove Works, and the machine worked to perfection, making the cut in sixty minutes, which was considered good work, it being the first connection larger than a 6-inch that we have made with it. If we had been obliged to make this connection the old way we would have been compelled to shut off the 42-inch main in that locality, which of itself would have been quite a task, besides the inconvenience it would have caused a large number of water

takers; then after cutting the pipe the enormous quantity of water to remove before the joint could be leaded would have been a task, the dimensions of which would have been exceedingly large, all of which was avoided by said machine.

The following statement will show the receipts and disbursements in the Service Cocks Department during the year 1894:

	Receipts for service cocks	\$5,281	00		
	Receipts from plumbers' licenses	608	15		
	Receipts from old service cocks		81

New Inspectors appointed November 10th, 1884.

In addition to the foregoing work, the inspectors have devoted much time to locating and making a record of all stopberes throughout the city. They are taking new measurements, as there has been so much changing and subdividing of lots since the beginning of our record, that in many instances we find the location not properly recorded, and when the box happens to be covered up, it takes much valuable time to find it, especially so in case of bursted pipes. As stated in a former report, "It necessitates the utmost vigilance to keep the stop-boxes exposed to view. Sidewalks being repaired, new ones built, or change of grade in street, alley, or lot, the tendency is to pay very little attention to the stop-box, and it is usually covered up, as the majority of property owners can see very little use for it until there is an urgent request to shut off the water on account of bursted pipes. when they have a forcible reminder of its necessity." only that, but during the last year there have been 13,729 places reported to be shut off for non-payment, besides 984 to be shut off for vacancy, showing the need of keeping the boxes in sight at all times. A duty that will always exist, will be that of seeing that they are kept in proper condition, and as there about are 50,000 of them at present, one can readily see that it will require much time and watchfulness on the part of the inspectors in giving them the necessary attention.

The increase of work in this Department necessitated the appointment of two more inspectors, said appointments being made by your honorable body in November last. There are now eight inspection districts to correspond with the assessors, so that each assessor has an inspector to attend to that portion of the work that comes directly under his control, something that saves considerable friction, as formerly one inspector received orders from two assessors, and at times the orders were somewhat conflicting, as both assessors occasionally wanted the inspector at the same time, all of which is remedied by the present division.

PLUMBERS AND PLUMBING.

We have had very little trouble with the plumbers of late, as the majority of them follow very cheerfully the rules and regulations governing their work.

The rule adopted by your honorable body requiring all plumbers to pass an examination before the Board of Plumbing Examiners, and produce a certificate from the Board of Health, as to their competency, before a license would be granted them from this office, created some friction, as a number of plumbers who had previously received a license failed to pass a successful examination, and therefore we could not grant them a permit to do plumbing. However, as they were allowed to appear before the examiners several times, the most of them finally succeeded in getting a certificate, and those who did not, the money they paid for their licenses was returned to them, and they were obliged to go out of the business.

Owing to the amount of work done by apprentices, we find that first-class plumbers need fully as much watching as the poorer ones, and that is why I think that a rigid inspection of all plumbing (by thoroughly competent inspectors), both as to material and workmanship, would produce the desired results. The most of the plumbers have succeeded in squeezing through an examination, and getting a certificate, but after all it does not make good plumbers of them. Being obliged to tear out their work, when not properly done, and do it over again, is a splendid educator, and after doing it a few times, they will either do good work, or go out of the business, either of which ought to be satisfactory.

REPAIRING LEAKS.

The General Superintendent placed this department under my control last July; since that time we have had no serious leaks to contend with. During the year there have been eleven breaks reported in the main pipes, two of them were in the 30-inch, one in the 24-inch, two in the 6-inch, five in the 4-inch, and one in the 3-inch, all of which were repaired without difficulty. There were also found 38 leaking joints, seven of which were in the 42-inch, three in the 30-inch, five in the 24-inch, one in the 16-inch, one in the 16-inch, and one in the 3-inch mains. Sixty-seven street

*Many years ago there was an estimate made of the number of service connections attached to the wood mains, as previous to that time there was no record hept of the number of such connections. Since the estimate was made, however, there has been a record kept each year of the number added, and also those removed. During the last year all wood mains have been taken out, and with them 605 service connections, leaving 8,508, which number must have been an error in making the original estimate, and will therefore have to be deducted from the total number, an shown in our last Annual Report, making (after adding those inserted during the year 1894) a total of 47,509 service connections in use on January 1st, 1886.

gates were reported leaking, and were repaired as follows: One 24-inch, one 10-inch, three 8-inch, twenty-nine 6-inch, twenty-eight 4-inch, and five 3-inch. One new 6-inch gate was set to take the place of one that could not be repaired.

Numerous leaks have been reported, which after being located, have been found to be on service connections, when they have either been shut off at the stop-box or at the main, as the necessities required, and then turned over to the owner or occupant for repairs.

All complaints of "bad water" have been given immediate attention. The complaints usually come from localities which get their supply from a pipe with a "dead end," and on which there is a "blow-off gate," the opening of which for a short time usually remedies the trouble, but, only temporarily, for as long as we have "dead ends," just so long will we get complaints of bad water, but as the number is gradually growing less, we hope the time is not far distant when they will all be done away with, as far as it is possible to do so. We have now 521 blow-off gates, (as against 667 the previous year), not all of which are on "dead ends" however, as many of them are permanently set at special points along the line of pipe.

We have had a great deal of trouble in this Department during the past season with "hemp" getting into the service pipes, as previously mentioned under the head of Meters. We have had to dig up fifty-six service connections, sometimes at the main, and at other times under the buildings, as it was liable to wedge itself into the pipe at any point between the main and faucet in the building. The foregoing trouble has occurred usually in the immediate vicinity of where the Iron Pipe Department were laying pipe, and was caused by some of the men allowing the packing to get into the pipe while they were calking the joints. As it only occurred on some special lines the fault was discovered, and since that time we have had very little trouble from that cause.

Owing largely to the efficiency and experience of our foreman, Mr. Wallace, the work in this Department has been done in the most satisfactory manner.

Attached to this report are complete lists of tools on hand, and an itemized account of material in stock in the Meter, Service Cocks and Repairing Leaks Departments on the 31st day of December, 1894.

In conclusion will say, that I think the men in the different departments over which I have charge, are entitled to much credit for the faithfulness with which they have done their work, all of them having shown a desire to give their best services to the works, to which they (the works) are entitled.

Thanking your honorable body for the very courteous and considerate manner extended me upon all occasions, the foregoing report is respectfully submitted.

T. R. PUTNAM, Sup't Meters and Inspection.

REPORT OF CHIEF ENGINEER AT PUMPING WORKS.

DETROIT, January 1, 1895.

To the Board of Water Commissioners:

GENTLEMEN — I have the honor to submit the Engineer's report for the year 1894.

The following table shows the number of gallons of water pumped, and cost of fuel for the years named:

YEAR.	GALLONS OF WATER PUMPED.	COST OF FUEL CONSUMED.	Average Daily Delivered.

Cost per million gallons, \$3.52. Nos. 1 and 2 Engines were run a good part of the year with pumps single acting.

The tables show that the water pumped during the year is 13,649,779,605 gallons. The total expense for pumping water is \$29,283.47, making the cost per million gallons, \$3.52. It will be noticed that the duty has fallen some, but this is accounted for by the additions to the heating and lighting

The following tables show in detail the work done by each engine each month of the year.

\$48,146 11

Cost per million gallons, \$3.52. Nos. 1 and 2 Engines were run a good part of the year with pumps single acting.

The tables show that the water pumped during the year is 13,649,779,605 gallons. The total expense for pumping water is \$29,283.47, making the cost per million gallons, \$3.52. It will be noticed that the duty has fallen some, but this is accounted for by the additions to the heating and lighting

plants, the steam for which is taken from the old boilers and hence affects the figured duty for engines Nos. 1, 2 and 3, and because during the past year we have only credited the engines with the work actually performed.

Our pressure has been carried higher at this station this last year than previously, and every foot in hight adds to the cost.

In connection with our lighting plant, I will say that it is being over-loaded. If the city lights could be used to light the grounds, we would be able to save additional expense in the lighting department. Our dynamos are one hundred light machines, and are now loaded to one hundred and twenty lights.

Crude oil as fuel is clean and convenient, but like other fuels it varies in quality, and I am satisfied has not the heating qualities as formerly; also, it is not convenient to measure. It is supposed to be sold at 60 degrees Fahr., and for every change of 25 degrees 1 per cent. added or deducted, as the case may require. It will readily be seen that if metered, we would be troubled with the same difficulty, but with gases collecting in the meter added.

The arrangements which I recommended in my last report, so as to convert our pumps from double to single acting without stopping, was completed and tested May 13th, and proved to be a great improvement, which has been needed ever since the reservoir has been discontinued. We not only save water by its use, but it does not leave the engines disabled as formerly, saying nothing of the convenience; but to complete its efficiency, I have recommended changing the Stevens cut-off for that of the Sickles, which I expect will be finished about the 10th of February. We would then be able to cut off at the point desired when working our pumps single acting, and would then get the benefit of the expansion of the steam, which means the saving in fuel.

Engines Nos. 1, 2 and 3 are in fair condition, although but minor repairs have been done to them this last year.

Since removing weight from fly-wheel of No. 1 engine,

and balancing by placing weight in piston instead, the engine runs much smoother.

The boilers are in fair condition, considering their age; but minor repairs have been made to them the past year. The boilers in the west room have been in service eighteen years. I would like to have them replaced with some of the latest improved. That would give us a higher pressure of steam, which I consider would be an improvement, for the pressure that has been carried has always been too low for a compound engine.

Previous to this fall and winter, we have been troubled with weeds and ice on our river strainers. I conferred with Mr. Kirby, and suggested taking every other slat out of face of strainer, which was done last summer, and I am satisfied it will be a great benefit. Instead of being blocked out in the river as formerly, we may be blocked at our inland strainers; if so, we can readily clear them.

In my last report it was recommended to discontinue the stand pipe, by placing additional relief gates on the pipes. I think it would be perfectly safe to shut it off, with what relief we now have on our engines, but, certainly, the higher the pressure added each year, the greater will be the strain on our pumps and connections. I consider, however, the stand pipe is not effective for the purpose of taking the pulsation off the pumps, or a guard against a water ram. Heavy bodies move slowly. That being the case, it is certainly no use for either purpose. The cause of the water ram or hammer which has been mentioned in former reports is not quite clear to me, for not having any valves or gates of sufficient size that could be closed quickly, I can see but one way to account for it, which is by air collecting in the pipes at some high part of the system.

The continuous running of our new triple expansion engine has been considerably interfered with by defects in the suction conduit, but the necessary alterations have now been made and no further trouble is anticipated. The engine has been run intermittantly for some time, but not at its full capacity long enough to show conclusively what duty it will perform. In

consequence, I have left duty space in table blank, but feel satisfied that it will come up to expectations. The official test we expect will be made some time in the beginning of the new year.

The new tile roof which was put on the engine house last fall is a decided improvement on slate, as it readily absorbs the condensation, which the slate would not do. The building is also warmer.

Respectfully submitted.

URIAH GOULD,

Engineer.

REPORT OF THE SUPERINTENDENT OF GROUNDS.

To the Honorable Board of Water Commissioners:

GENTLEMEN—In submitting my report for the year, I beg leave to say your predecessors certainly made no mistake in acquiring this splendid site for the City Water Works. The improvements under your direction and the gentlemen who have preceded you, must be a source of gratification to you and the citizens of Detroit.

Facts and figures show it to be a pumping station that for efficiency and beauty is equalled by few and excelled by none.

The surrounding Park is rapidly coming into a high state of cultivation, and the multitudes who visit it testify that as a place of rest and recreation, it is one of which the citizens of Detroit may justly feel proud.

Of the improvements completed this season, the Hurlbut Memorial Gateway notably is a thing of beauty and grandeur that will perpetuate the name of Chauncey Hurlbut for hundreds of years.

The winding canal dredged from the river through what was previously a low marsh, has greatly improved this part of the grounds. The leveling and planting of trees and shrubs make this a valuable addition to the Park. It will, however, be two or three years before the ground will be firmly settled and covered with good sod. Of the two islands the larger has been planted with trees and shrubs, while the smaller one will be kept for flowers.

Another of this year's improvements is our water pipe system for sprinkling purposes, which is now complete.

There are a few needed improvements which I hope you will order the coming year, i. e., a ladies' toilet room and a

shelter for horses. I have mentioned these in former reports, but as they are so much needed, I take the liberty of calling your attention to them again. Within a year or so we should have some good substantial bridges across the winding canal—one team and two foot bridges. The temporary bridges will answer for the present.

I understand the Superintendent and Secretary has already recommended the removal of the old dock and the fence around the basin. The dock is fast going to decay and is an eyesore. I hope you will order it removed soon, as we have no use for it other than an earth embankment between the basin and the canal. The fence was erected probably to keep animals from the water, but as no animals are allowed to run at large in the Park now, it has become useless, and that part of the Park will be very much improved by having it removed.

The lighting of the grounds is hardly satisfactory, as the recent addition to the engine house and the new engine require all the light the dynamos are able to furnish. I would be pleased to have the outside lighting done by the public lighting plant.

Our greenhouse stock is in splendid condition. Although we are in need of more room, we hope by skillful management to make a floral display equal to any in the country next season.

With this I enclose invoice of movable property in this Department.

Respectfully submitted.

E. A. SCRIBNER,
Superintendent of Grounds,

REPORT OF THE SUPERINTENDENT OF EXTENSIONS.

DETROIT, MICH., January 2d, 1895.

To the General Superintendent and Secretary:

DEAR SIE—In accordance with the regulations of the Board of Water Commissioners, I have the honor of presenting to you my Annual Report, relative to the general condition and progress of the work in this Department.

The records of the year just closed reveal the fact that not less than 39 miles of extensions have been added to our pipeage.

The work of the year has been one of ceaseless activity, there having been but little cessation in the work of extensions during each month of the year, the average having been about 3.25 miles per month.

It may be seen by the records of this office that the greater number of lines laid have been for the replacing of wood and smaller lines of iron pipe, and otherwise improving the pipeage system. There is now but 950 feet of the log pipe left in use, and this is only temporarily left in. The coming season will no doubt see the closing up of this system. Seven hundred and twenty-five feet of this log pipe will be found in the abandoned section of Holden avenue, between Second and Third avenues; the other 225 feet is also in a vacated alley north of Grand River avenue, from west line of Lincoln avenue to alley west, left in to cure a dead end.

While it may be in order to congratulate ourselves that the old log-pipe system is now so near its extinction, we can not but remember how great a part it has played in the extension of the borders of this our beautiful city, though meager in its supply.

The laying of the pipe for the past year has been very generally distributed through the city, with the view of strengthening some of the weak points. I am pleased to know that many of these lines, as appearing in the records of our work of the past year, are among the recommendations of 1891, 1892 and 1893. Not a few of the larger lines were laid in the more central portions of the city, as well as in adjacent sections. Two rather lengthy lines were laid, extending beyond the city limits. One of 6- and 8-inch pipe was laid along Jefferson avenue to the new Driving Park, and the other, a 6-inch pipe, in line of Mt Elliott avenue, to the Forest Lawn Cemetery.

The principal lines appear in the following list of lines laid, as per size of pipe and locations: A line of 16-inch was laid in the upper section of the city, through Farnsworth street and Kirby avenue. This line takes its supply from the upper 42inch main in Canfield avenue, running northerly in Dubois street to Farnsworth street, and thence westerly in Farnsworth street to Rivard street, and from this point northerly to Kirby avenue, and in Kirby avenue from Rivard street to Cass avenue. all intersecting lines of pipe connecting thereto. From the westerly end of this main, a line of 10. and 12-inch pipe was laid in Cass avenue, the 12-inch being a short section, running from Kirby avenue south on the east, to Kirby avenue north on the west, distance about 150 feet. On Cass avenue, a line of 10inch pipe was laid from Kirby avenue south to Warren avenue, and from Kirby avenue north to Holden avenue. From this line on Cass avenue, two lines of 10-inch and one of 8-inch were laid in a westerly direction, the one in Holden and Bratshaw avenues running from Cass to Fourth avenues, thence from this point in Fourth avenue to Holden avenue, and from this point at Fourth avenue a line of 8-inch pipe was laid to the North Boulevard. The second line of 10-inch pipe was laid in Kirby avenue, from Cass to Trumbull avenues, and from which an 8-inch pipe was laid in Kirby avenue to Twelfth The 8-inch line was laid in Warren avenue, from Case Two lines of 12-inch main were laid in the to Third avenues. central portion of the city, one of which was in Monroe ave-

nue, from the 24-inch main in Cadillac Square, connecting with the same, and running north to Randolph street. line of 12-inch main takes a zig-zag course, connecting with the 30-inch main in Mullett street at Hastings street, thence running north in Hastings street to Catherine street, and westerly in Catherine street to the intersection of Gratiot avenue and St. Antoine street, connecting with the 6- and 10-inch pipe in Gratiot avenue. From this point the line takes a northerly direction in St. Antoine street to Elizabeth street, and in this street westerly to Beaubien street. From this point it again runs northerly in Beaubien street to Adelaide street, and in Adelaide street from Beaubien street to Brush street. this point the line was reduced to 10-inches, the line running northerly from this point to Edmund Place connecting with the 24-inch main at this point. In addition to the above, 10inch pipe was laid in Baldwin avenue, from Waterloo street to Gratiot avenue; Hamilton Boulevard, from Blaine avenue to Hazelwood avenue: Oakland avenue, from Belmont avenue to Harmon avenue, and from the North Boulevard to Horton avenue: also from Hamlin avenue to Marston Court.

The 8-inch pipe covers a distance of over 7 miles. Some of the lines were in consecutive order as follows: Beaubien street, running north from the 30-inch main in Gratiot avenue to Madison avenue, and from this point westward in Madison avenue to Brush street; thence north in Brush street to Elizabeth street, and westward in Elizabeth street to Park street. Benton street, from Beaubien street to Brush street; thence north in Brush street to Rowens street; westward in Rowens street to John R Street, and northward in John R street to Brady street. A line of 8-inch was laid in Adelaide street. from Brush street to Woodward avenue, and in High street, from Brush street to Woodward avenue. A line of 8-inch was also laid in consecutive order as follows: Brady street, from the 10-inch main in Beaubien street to Brush street; thence north in Brush street to Alexandrine avenue, and from which a line of 6-inch pipe was laid in Alexandrine avenue to John R Eight-inch pipe was also laid in Columbia street from

Beaubien street to John R street, and in Bagley avenue from Park street to Grand River avenue; also in Rowland and Griswold streets, from Michigan avenue to Clifford street. This line connects with the 24-inch main in Michigan avenue, and the 30-inch in State street. A line of 8-inch was laid in Martin Pl., from John R street to Woodward avenue. Two sections of 8-inch pipe were laid in Twelfth street; the lower section was from River street to Lafayette avenue, the upper section from Howard street to Baker street, and from which a line of 6-inch was laid in Howard street, from Tenth street to Twelfth street. The 8-inch line will connect with the new 12-inch main to be laid in Porter street. An 8-inch line was laid in alley east of Woodward avenue, from end of pipe north of Gratiot avenue to John R street; also in Woodbridge street, from Woodward avenue to St. Antoine street; and from this point in said street a 6-inch pipe was laid to Orleans street. The following 8-inch lines were laid in the more easterly and westerly portions of the city: West side: in Clark avenue from Fort street to end of pipe south of Dix avenue. This is now a continuous line of 8-inch from River street to M. C. R. R., connecting with the 10-inch main in Dix avenue and the 8-inch in Fort street; Thirty-fourth street from Jackson street to Michigan avenue: Vinewood avenue, from Merrick avenue to Grand River avenue. East side: Trombly avenue, from Dubois street to St. Aubin avenue; Dubois street, from Piquette avenue to Trombly avenue; Hastings and Theodore streets to Warren avenue; Oakland avenue, from Englewood avenue to Harmon avenue; Indiana street, from Beaubien street to Russell street; Leland street, from Dequindre street to Russell street, and in Van Dyke avenue south of Worcester street. There has been over 25 miles of 6-inch pipe laid, covering over 300 locations and ranging in lengths from 5 to over 8,000 feet.

In addition to the lines above mentioned, ten connections have been made of 8- and 10-inch diameters, with the upper 42-inch main in Mack avenue. The following are the points of connections: Ellery, Meldrum, Beaufait, Canton, Sheridan, Townsend, Helen, Fisher, Belvidere, Rohns, Holcomb and

Maxwell avenues. When this line of 42-inch main was laid, only 50 per cent. of the above-mentioned avenues were platted, and these but a short distance north of Jefferson; the balance were not platted until a number of years later, otherwise, branches would have been set at the street intersections. Such as were properly open at the time were provided with branches.

PIPEAGE.

The amount of distribution pipe and mains laid and re-laid, and iron and wood pipe discontinued during the past year, is as follows: Total iron pipe laid and re-laid 392225 miles, of which 814 feet were re-laid; 32225 miles of wood and 82225 miles of iron pipe were discontinued, making the net increase of the pipeage, 272225 miles. This amount added to the measured lines of iron and wood pipe connected with the works will make the total length 4832225 miles, of which 4832225 miles are iron, and 951 feet are wood pipe, which in detail is as follows:

SIZE OF PIPE IN INCHES.	MEASURED LENGTH IN FRET FOR 1898.	ADDED LENGTH IN FEET FOR 1894.	DISCONTINUED LENGTH IN FRET FOR 1894.	TOTAL LENGTH IN FEET FOR 1894.
45	103			108
42	45,127	80		45,207
36	715			715
80	49,337			49,837
24	84,818			84,813
20	461	<i></i>		461
18	87			87
16	36,777	8,460		45,237
12	8,444	8,675		12,119
10	114,509	14,075		128,584
8	219,795	38,641		258,436
6	917,408	185,019	3,974	1,048,458
4	831,348	5,810	36,058	801,100
3	76,302	2,166	5,211	78,257
2	2,820			2,820
Total,	2,388,046	207,926	45,243	2,550,729

When I was appointed Superintendent of Extensions and Repairs in the early season of 1877, I found the total pipeage of the city did not exceed 187½ miles, of which 94½ miles was of iron, and 92½ wood pipe. During the interval which has elapsed between the opening of the season of 1877 and the closing of 1894, the log pipe system has disappeared, less the 950 feet previously mentioned, while that of the iron pipe has increased over 500 per cent., making the total increase of the pipeage 258 per cent.

There were connected with the water mains 140 hydrants and 26 reservoirs, making the total number now in use 2,478 hydrants and 520 reservoirs.

I am glad it has appeared wise to you to place the care of our water-gates, and the appurtenances thereto, in competent hands. The unskillful handling of this branch of the pipe system during the early part of last year, and the latter part of the previous year, has been the cause of endless annoyances. I am now looking forward, with special interest, to the abatement of the former annoyances. Mr. John Bridge, whom you have appointed Superintendent of this Department, with his practical mechanical abilities, should be sufficient guarantee that this branch of the works is in efficient hands.

Owing to the cause of some unforeseen changes in the office of this Department during the past year, it has in some measure complicated our work, which for a time has been a source of additional care. I trust, however, that the opening season, with our increased force of clerical help, under the efficient supervision of Mr. A. W. Goodsell, will be the means of a complete and satisfactory showing of this Department work.

The last-mentioned table gives the total number of watergates in the pipeage system, name of maker, number of each size, and percentage of each manufacture. The following table gives the length of 3-, 4- and 6-inch pipe and logs which have been replaced with pipe of larger size, in detail, as follows:

	80	E OF	PIPE LAID.	SIZE OF PIPE AND LOGS REPLACED. LENGTH OF LAID.	PIPE
4 -i	inch	iron	pipe	. S-inch iron pipe 5	feet
4	• •	"	· 44	. Log pipe 2,928	66

	То	TAL.		64,414	

I take the liberty of drawing your attention to some statements which appeared in the last Annual Report, and which I think were unadvisably made, as the showing of the past year's work will forcibly reveal. I refer to the large percentages of the pipe-joints said to be found leaking. The past year's work of replacing eight and a half miles of pipe, more than seven-eighths of which was exposed and also taken out, failed to develop five per cent. of such leaks, as well also the numerous service connections in this length of pipe. I think two per cent. would have been nearer correct. I simply make this statement in justice to myself, from the severe criticism which appear in a previous report.

The men whom I have employed as calkers are very efficient

in this class of work, as well as pipe-fitters. Several of these men have had more than twenty years' experience, and have been that length of time in the employ of the works, and I believe their highest ambition is to know that their work is approved. I would also state that any intricate work, such as the cross-street intersections, and all such special work, is left exposed until tested.

REPAIR DEPARTMENT.

Owing to your readjustment of the different branches of the works, the supervision of the Repair Department will now appear with the Meter Department.

The work of this Department while under my care, with Mr. John Wallace as its chief foreman and his corps of faithful men, the numerous items of work falling to this department were efficiently met.

PUMPING WORKS.

Since the completion of the last connection of the 42-inch mains to the No. 4 Engine and the suction pipe, I have had but little work to do at this place.

It would be a breach of courtesy not to mention your kindness and forbearance of the many calls we have had to make upon your attention. I am pleased to say, that the co-operation with the Civil Engineering and the Meter and Repair Departments has been of a pleasant character.

Transmitted with this report are the locations of the pipeage of the city to January 2, 1895.

Respectfully submitted.

HENRY BRIDGE,
Superintendent of Extensions.

I am glad it has appeared wise to you to place the care of our water-gates, and the appurtenances thereto, in competent hands. The unskillful handling of this branch of the pipe system during the early part of last year, and the latter part of the previous year, has been the cause of endless annoyances. I am now looking forward, with special interest, to the abatement of the former annoyances. Mr. John Bridge, whom you have appointed Superintendent of this Department, with his practical mechanical abilities, should be sufficient guarantee that this branch of the works is in efficient hands.

Owing to the cause of some unforeseen changes in the office of this Department during the past year, it has in some measure complicated our work, which for a time has been a source of additional care. I trust, however, that the opening season, with our increased force of clerical help, under the efficient supervision of Mr. A. W. Goodsell, will be the means of a complete and satisfactory showing of this Department work.

The last-mentioned table gives the total number of watergates in the pipeage system, name of maker, number of each size, and percentage of each manufacture. The following table gives the length of 3-, 4- and 6-inch pipe and logs which have been replaced with pipe of larger size, in detail, as follows:

	811	e of	PIPE LAID.	Size of Pipe and Logs Replaced. Length of Laid.	Pipk

	То	TAL.			••

I take the liberty of drawing your attention to some statements which appeared in the last Annual Report, and which I think were unadvisably made, as the showing of the past year's work will forcibly reveal. I refer to the large percentages of the pipe-joints said to be found leaking. The past year's work of replacing eight and a half miles of pipe, more than seven-eighths of which was exposed and also taken out, failed to develop five per cent. of such leaks, as well also the numerous service connections in this length of pipe. I think two per cent. would have been nearer correct. I simply make this statement in justice to myself, from the severe criticism which appear in a previous report.

The men whom I have employed as calkers are very efficient

in this class of work, as well as pipe-fitters. Several of these men have had more than twenty years' experience, and have been that length of time in the employ of the works, and I believe their highest ambition is to know that their work is approved. I would also state that any intricate work, such as the cross-street intersections, and all such special work, is left exposed until tested.

REPAIR DEPARTMENT.

Owing to your readjustment of the different branches of the works, the supervision of the Repair Department will now appear with the Meter Department.

The work of this Department while under my care, with Mr. John Wallace as its chief foreman and his corps of faithful men, the numerous items of work falling to this department were efficiently met.

PUMPING WORKS.

Since the completion of the last connection of the 42-inch mains to the No. 4 Engine and the suction pipe, I have had but little work to do at this place.

It would be a breach of courtesy not to mention your kindness and forbearance of the many calls we have had to make upon your attention. I am pleased to say, that the co-operation with the Civil Engineering and the Meter and Repair Departments has been of a pleasant character.

Transmitted with this report are the locations of the pipeage of the city to January 2, 1895.

Respectfully submitted.

HENRY BRIDGE,
Superintendent of Estensions,

REPORT

OF THE

BOARD OF WATER COMMISSIONERS

OF THE

CITY OF DETROIT.

To the Honorable the Common Council of the City of Detroit:

Gentlemen—The Board of Water Commissioners of the City of Detroit, in compliance with a time-honored custom, respectfully submit herewith a report for the year ending December 31st, 1895.

The extent and importance of the affairs under the management of this Board have required a subdivision and classification of the work, with corresponding heads of departments. These executive officers each year furnish detailed reports, which it is hoped your honorable body will find time to examine. Besides the important report of the General Superintendent and Secretary, carefully prepared statements are submitted by the Civil Engineer, the Superintendent of Gates, the Superintendent of Meters and Inspection, the Chief Engineer at the pumping station, the Superintendent of Grounds, and the Superintendent of Extensions.

A number of extraordinary improvements during the past year require special mention. The most important of these is the construction of a forty-two-inch main, extending from the pumping station in a direct line to Chene street, a distance of 14,000 feet. This main, while largely increasing the supply, will reinforce the pressure of the entire system. Though practically completed, it will not be put into operation until the close of the winter season. The cost of this improvement has been the sum of \$180,000. To aid in meeting this expense bonds were issued, as authorized under the act of 1873, in the sum of \$100,000. These bonds are payable in 1925, bearing 4 per cent. interest in gold. The premium obtained upon the sale of these bonds was the sum of \$11,100, which reduces the interest from 4 per cent. to 3½ per cent. The balance of \$80,000 required for this main has been met from the general income.

The new Allis pumping engine has been accepted, after a thorough examination and test by experts, and the contract for roofing the engine house with tile has also been finished. Another important piece of work at the pumping station, which was both begun and completed this past senson, is the new embankment between the settling basin and the canal. The amounts paid for the balance due upon last year's contracts and the work of this year at the pumping station amount to the sum of \$35,000.

The rapid growth of the city and the additional burdens placed upon the pumping department will require constant expansion in the facilities for meeting these demands, and we are compelled to pass over to the coming year obligations for about \$30,000 for four new boilers which are to be purchased, and for the necessary apparatus for handling and carrying coal.

A bronze bust of the late Chauncey Hurlbut has been mounted upon an Aberdeen granite pedestal in the memorial gateway. It is fitting that we should gratefully acknowledge the valuable services of Mr. Hurlbut while living and the provision that he has made for a perpetual beneficence. His will equally provides for two objects: the care and improvement of the grounds, and also the maintenance of a library. It is hoped that some arrangement may be consummated by which a branch of the Public Library shall be established at the Park. Many of the larger cities

are maintaining branch libraries, giving remote sections convenient opportunities of drawing books from the Public Library. The attractive features of this park and the rapid increase in population in its vicinity give a most favorable opportunity to introduce this method in our city.

We desire to call special attention of your honorable body to the efforts of this Board made during the past year to obtain the passage of a bill in the Legislature providing for the payment of new pipe by abutting property. This bill passed the House, but not the Senate. Under the present system, a large amount of pipe has been laid which is not used by the property through which it extends, and this expense has been unfairly borne by the general consumer. Whatever other methods may be adopted in the future relative to the supply of water, it is hoped that the abutting property act, at the next session of the Legislature, will pass the barriers of both Houses and receive the signature of the Executive.

The Board desire to encourage a wholesome interest in the quality as well as in the quantity of the liquid which it is its province to furnish. The Board of Health and the medical profession should bear a responsibility for the healthfulness of the water supply, and this Board will welcome any information or enlightenment relative to these important matters. Physicians agree, so far as they are agreed upon any one thing, that typhoid is an indication of unwholesome water, while diphtheria is attributed to defective sewerage. Statistics, covering a series of years, show that Detroit has suffered least from Typhoid of any of the lake cities, while Chicago and Toronto have suffered most. The reverse is true of diphtheria, Detroit leading the list. There is nothing in the location of Detroit to prevent its being most healthful. The cities of Holland, notwithstanding the disadvantage of a moist and swampy territory, enjoy the greatest freedom from disease. With extraordinary difficulties in the way of thorough drainage and a satisfactory supply of water, Amsterdam, Rotterdam and The Hague, by sanitary science and enlightened municipal administration, have become model cities of the world in cleanliness and health.

Comparison with other cities places Detroit in the front rank as to its methods and facilities in the supply of water, and, with only one or two exceptions, where the supply is furnished by gravity, our rates are the lowest in the country. Untrammeled by traditions or prejudices, we stand ready to adopt any methods that, after careful examination, are proven for the greater benefit of the people.

In respectfully submitting the foregoing report, we desire to express our appreciation of the uniform courtesy which has been extended by your honorable body to this Board, and for the existing friendly relations.

FRANK E. KIRBY,
ALBERT L. STEPHENS,
DEWITT H. MORELAND,
EDWARD W. PENDLETON,
DARIUS D. THORP.

Board of Water Commissioners of the City of Detroit, January 2, 1896.

REPORT

OF THE

GENERAL SUPERINTENDENT AND SECRETARY.

January 2d, 1896.

To the Board of Water Commissioners:

Gentlemen—I respectfully submit my report of the general construction and operation of the Works for the year 1895, together with a financial statement of the receipts and disbursements of the Board during the same period.

The disbursements amounted to \$645,829.15, and the receipts to \$651,545.74.

Included in the disbursements are \$50,000 of bonds redeemed in February, and \$173,055.77 paid, up to January 1st, for the laying of the new forty-two-inch force main, also the sum of \$26,442, charged to pumping works, all of which was expended in completing the contracts for the new engine, engine house, etc., and the removal of the dock between the settling basin and the canal and the substitution therefor of an earth embankment.

Taking the sum of these expenditures, \$249,498.12, which are plainly of an extraordinary nature, from the total expenditures, and we have \$396,331.03, which represents the expenditures for operation and maintenance and for what may be called ordinary extensions and construction.

Included in the receipts are \$100,000 of bonds, sold by the Board, and \$12,062.43 premium received thereon. Deducting the sum of these two amounts from the total receipts, and we have \$539,483.31, which represents the receipts of the Board from the ordinary resources, and which are in excess of its ordinary expenditures by \$143,152.28.

Considering the fact that there are on hand about 1,300 tons of iron pipe, which will so far reduce the expenses for ordinary extensions the coming season, and considering also the fact that the Board has about 3,500 tons of "steamboat" coal, which it can utilize either by its sale or by burning it with an equal quantity of slack, I think the Board can safely calculate upon having for the year 1896 a sufficiently large revenue to meet all of its obligations.

The bonds falling due in the immediate future are \$50,000 December 1st of this year and \$100,000 April 1st, 1897. The next bonds coming due thereafter are \$100,000 September 1st, 1899.

IRON PIPE DEPARTMENT.

capenditures of this department, including the for forty-two-inch force main, was \$336,880.59.

Addition of this new force main, the pipe system distribution is so complete that it will need but expenditure the ensuing year. During the the ordinary extensions, consisting of six-inch, ten-inch and twelve-inch pipe, amounted to 1,890 there is on hand at the present time of these sizes to use and if extensions in 1896 compare, as I think will, with those of 1895, possibly 1,000 tons would satter requirements. Certainly the estimate made in December of 1,750 tons will be ample.

the keeper of the storage grounds reports to me the saving during the year, made by the Board doing its own hauling, to be \$3,698.57. This is arrived at on the basis of the contract for hauling in 1894, and by estimating the expense of feeding and shoeing each horse to be \$12 per month.

The Superintendent of Extensions reports to me, upon the completion of each extension, the entire cost thereof in detail, from which reports I am satisfied that notwithstanding the fact that the Board established eight hours to be a day's work, paying the common laborer therefor \$1.50, that the expense of laying pipe has not been materially increased on

that account. To the fact that the Board employed many men who were really unfit to perform hard labor, but who were citizens in actual need and who could not be refused, may be ascribed any increase over what is usually considered an economical cost.

Connected with this department is the gang of men that was organized in August of 1894 under the charge of John Bridge, which was to have entire charge and control of the valves of the system, and whose duties were to make a systematic examination thereof, to repair valves that were found out of order and to attend to their operation whenever the exigencies of the service might require.

There are about 6,000 gates or valves in the system, and their condition and the frequent breakages that occurred proved that, although they are not of as delicate workmanship as a watch, yet it is almost as necessary in operating them that the men doing so must be as skilled in their workmanship and how to handle them as the watchmaker is of the watch he is repairing.

An examination of their work during the past year will be of interest, and shows how necessary it is to the wellbeing of our pipe system. It is as follows:

5,128 valves were examined.

671 were found out of order.

623 were repaired.

94 were found shut and opened.

331 were fitted with larger heads to stem.

172 new valves were opened.

59 gate wells were built.

234 wells were rebuilt or readjusted.

147 wells were cleaned.

237 wells were repaired.

170 wood boxes replaced with iron boxes.

31 iron boxes were repaired.

387 boxes were readjusted on account of paving.

1,768 gates were shut and opened for various purposes.

40 blow-offs were repaired.

841 gate wells cleaned of ice and snow.

PUMPING WORKS.

It is with considerable pleasure that I reflect upon the changes made by the Board at the pumping works the past year, more particularly the removal of the fence around the basin, and the substitution for the wood dock between the basin and the canal of an earth embankment. Neither the fence nor the dock were useful or ornamental and it has been my wish for years that they should be done away with.

The abandonment of the stand-pipe and the substitution therefor of relief values was another step in the right direction, and when one onsiders how much more efficiently these sample and the property of the stand-pipe and tower were consumpted one one only the stand-pipe and tower were consumpted one one only the way it was not thought of before.

As you are a war the closest attention has been given, a count of the subject of the fuel used at the pumpous because it was estimated that a construct of the subject of the fuel used at the pumpous because it was estimated that a construct of the subject of the fuel used in this direction that oil and the subject coal in 1892.

testablishment of the settling basin almost the smoke-stack, the Board was obliged to the stack of cleanliness. The mask by the burning of oil as a fuel, as compared to the seen in previous years with coal, will be seen by the stack of the stack of the seen by the seen by the stack of the stack of the seen by the seen by the stack of the stack of the seen by the stack of the stack of the seen by the stack of the stack of the seen by the stack of the stack of the stack of the seen by the stack of the stack of the seen by the stack of the stack of the seen by the stack of the seen by the stack of the seen by the stack of the seen by the stack of the seen by the stack of the seen by the stack of the seen by the stack of the seen by the stack of the seen by the seen b

_	_	_	_		

The saving effected the past year, as shown by the table, exceeded that of the previous two years by about 25 per cent and is due to the economy of the new engine and to the charges made by Chief Engineer Gould in the arrangement of the pumps in the old engines.

The price of oil, as will be seen in the table, was 1.50 cents per gallen in 1892, 1.52‡ cents in 1893, 1.55 cents in 1884, 1.61 cents the first nine months in 1895, and 2.18 cents from the four lst. Our present contract, running from October 1st. Our present contract, running from October 1st. April next, is at the latter figure, at which the cest of pumping water is about the same as with hard coal, just the latter. This is shown in the following table:

It will be seen by this table that during the first five months of the year "crude" oil was used, with an average of 137-140 gallons consumed for each one million gallons of water pumped. In May, at the earnest solicitation of the contractor, and with the knowledge that the works would be benefited thereby, the contract for crude oil at 1.61 cents per gallon to July 1st was vacated and a new contract for "fuel oil" substituted therefor to October 1st at 1.55 cents per gallon. With "fuel" oil during June, July, August and September, one mit oon gallons of water was pumped with an average of 127-22 callons of oil. During the latter part of the order and the sign of the second 125-58 gallons of oil to a not the sign of water.

the state of the control of the state of the

to be so an of nowed it will be seen that the cost in local so be notified one million god as a water with the 20% one per gallon, was \$2,75%, which are 161 cents, which are price, would have been \$2,000 and nowes in the cost of pumping of 33,23 per cent.

Considering this fact that at this price as both memconsidering this fact that at this price as but little less than with hard coal, and with the knowledge that attachments for the almost complete combustion of soft coal had been successfully manufactured, your honorable body determined to have the four new boilers, for some time contemplated, designed and built for the burning of soft coal, screenings or slack, as might prove most advantageous.

It was estimated, with this arrangement, that our fuel

bill, which would amount to over \$40,000 annually with oil at 2.18 cents, would certainly be reduced to \$25,000, if it would not, as some asserted, be reduced one-half.

The Allis engine was given its final test in July. Mr. George H. Barras, of Boston, was employed by the Board to make the test, and July 24th submitted his report, a synopsis of which will be found immediately after the report of Engineer Gould. He reported, in brief, that the efficiency of the engine exceeds the guarantee of the maker, and upon that report it was accepted by the Board.

METERS.

The number of meters attached during the year was 589, making the total in service of 3,775. The report of the Superintendent of that department gives everything concerning the work in detail and contains much that is interesting. He has gleaned certain facts in regard to the death

rate of different cities, which he engrafted in his report, and which are valuable information.

The quantity of water passing through meters is 14 5-10 per cent of the whole quantity pumped, and, with 25 per cent taken off from this whole quantity for that which is used for public purposes, for lawn sprinkling and for leaks in the mains, it is 19 5-20 per cent of the balance, or the usable quantity.

The receipts for metered water during the year were \$89,392.72, or 20 8-10 per cent of the entire water rates, which indicates that but a small fraction of one cent is received by the Board for each 1.000 gallons of metered, more than is received for the numetered water, and that as close a correspondence is maintained between the two rates as is possible or right

The come of a new asked is it fair to "A" to pla - a material require him to pay for every drop h - drug he wastes, and for every drop that want baking pipes and fixtures, when "R" · whether he wastes any or ... um the year round. The answer is: It see to "B." "A" belongs to a class of concar . Know every gallon they use, both in fivi 1 nely. "B" belongs to a class of whom we , when they use collectively, but not individ was cach class, as above stated, we receive prac-, whe sum for each 1,000 gallons. If "A" desires , was and economical he can do so and get the entire ... hereof. If "B" desires to be careful and saving he hat he gets no benefit therefrom and, there being adacement for economy, he disregards the fact of runand leaking fixtures, because they do not, as he thinks, cost him anything. In other words, the unmetend consumers are tied together, each suffering his share of the expense for the carelessness and wastefulness of any one or all of them. The "B's" are becoming aware of this. and are descriing the ranks of the unmetered consumers for

the metered. Five hundred and twenty-nine persons, at their own request, had meters placed on their premises the past year.

EFFECT OF RESTRICTING WASTE.

Inasmuch as it is a fact that water costs directly in proportion to the quantity pumped, and as it is now an admitted fact that running streams do not in the least assist in keeping the sewers clean or in any way effecting the dislodgment of the solid accumulations therein, as has been often claimed, and, further, as there is no other known good purpose that is conserved by supplying a larger quantity than is necessary for the various uses of a community, mechanical, domestic and otherwise, it certainly follows in the interest of economy and good government that the pumping of an excessive amount should be prevented.

Upon this principle the Board in 1889 adopted the policy of introducing meters as rapidly as circumstances would permit, and has pursued the same policy up to the present time.

The following table proves conclusively that where no restrictive measures are used the quantity consumed increases much faster than the population. That this is not due to an increase in the manufacturing interests of the city will appear later on:

rate of different cities, which he engrafted in his report, and which are valuable information.

The quantity of water passing through meters is 14 5-10 per cent of the whole quantity pumped, and, with 25 per cent taken off from this whole quantity for that which is used for public purposes, for lawn sprinkling and for leaks in the mains, it is 19 5-20 per cent of the balance, or the usable quantity.

The receipts for metered water during the year were \$89,392.72, or 20 8-10 per cent of the entire water rates, which indicates that but a small fraction of one cent is received by the Board for each 1,000 gallons of metered, more than is received for the unmetered water, and that as close a correspondence is maintained between the two rates as is possible or right.

The question is often asked, is it fair to "A" to place a meter on his premises and require him to pay for every drop he uses, for every drop he wastes, and for every drop that passes away through leaking pipes and fixtures, when "B." his neighbor, is not metered and, whether he wastes any or not, pays a stated sum the year round. The answer is: It is fair to "A" but not to "B." "A" belongs to a class of consumers of whom we know every gallon they use, both in livilually and collectively. "B" belongs to a class of whom we know every gallon they use collectively, but not individnally. From each class, as above stated, we receive protically the same sum for each 1,000 gallons. If "A" desires to be saving and economical he can do so and get the entire benefit thereof. If "B" desires to be careful and saving be realizes that he gets no benefit therefrom and, there being no indocement for economy, he disregards the fact of ranning streams and leaking fixtures, because they do not so he thinks, cost him anything. In other words the agontered consumers are tied together, each outleaning by of the expense for the carelessness and w one or all of them. The "Wa" are be and are deserting the ranks of the

the metered. Five hundred and twenty-nine persons, at their own request, had meters placed on their premises the past year.

EFFECT OF RESTRICTING WASTE.

Inasmuch as it is a fact that water costs directly in proportion to the quantity pumped, and as it is now an admitted fact that running streams do not in the least assist in keeping the sewers clean or in any way effecting the dislodgment of the solid accumulations therein, as has been often claimed, and, further, as there is no other known good purpose that is conserved by supplying a larger quantity than is necessary for the various uses of a community, mechanical, domestic and otherwise, it certainly follows in the interest of economy and good government that the pumping of an excessive amount should be prevented.

Upon this principle the Board in 1889 adopted the policy of introducing meters as rapidly as circumstances would permit, and has pursued the same policy up to the present time.

The following table proves conclusively that where no restrictive measures are used the quantity consumed increases much faster than the population. That this is not due to an increase in the manufacturing interests of the city will appear later on:

rate of different cities, which he engrafted in his report, and which are valuable information.

The quantity of water passing through meters is 14 5.10 per cent of the whole quantity pumped, and, with 25 per cent taken off from this whole quantity for that which is used for public purposes, for lawn sprinkling and for leaks in the mains, it is 19 5-20 per cent of the balance, or the usable quantity.

The receipts for metered water during the year were \$89,392.72, or 20 8-10 per cent of the entire water rates, which indicates that but a small fraction of one cent is received by the Board for each 1,000 gallons of metered, more than is received for the unmetered water, and that as close a correspondence is maintained between the two rates as is possible or right.

The question is often asked, is it fair to "A" to place a meter on his premises and require him to pay for every drop he uses, for every drop he wastes, and for every drop that passes away through leaking pipes and fixtures, when "B." his neighbor, is not metered and, whether he wastes any or not, pays a stated sum the year round. The answer is: is fair to "A" but not to "B." "A" belongs to a class of consumers of whom we know every gallon they use, both in livi lually and collectively. "B" belongs to a class of whom we know every gallon they use collectively, but not individually. From each class, as above stated, we receive practically the same sum for each 1.000 gallons. If "A" desires to be saving and economical he can do so and get the entire benefit thereof. If "B" desires to be careful and saving he realizes that he gets no benefit therefrom and, there being no inducement for economy, he disregards the fact of running streams and leaking fixtures, because they do not, as he thinks, cost him anything. In other words, the unmetered consumers are tied together, each suffering his share of the expense for the carelessness and wastefulness of any one or all of them. The "B's" are becoming aware of this, and are deserting the ranks of the unmetered consumers for

the metered. Five hundred and twenty-nine persons, at their own request, had meters placed on their premises the past year.

EFFECT OF RESTRICTING WASTE.

Inasmuch as it is a fact that water costs directly in proportion to the quantity pumped, and as it is now an admitted fact that running streams do not in the least assist in keeping the sewers clean or in any way effecting the dislodgment of the solid accumulations therein, as has been often claimed, and, further, as there is no other known good purpose that is conserved by supplying a larger quantity than is necessary for the various uses of a community, mechanical, domestic and otherwise, it certainly follows in the interest of economy and good government that the pumping of an excessive amount should be prevented.

Upon this principle the Board in 1889 adopted the policy of introducing meters as rapidly as circumstances would permit, and has pursued the same policy up to the present time.

The following table proves conclusively that where no restrictive measures are used the quantity consumed increases much faster than the population. That this is not due to an increase in the manufacturing interests of the city will appear later on:

1895	51,426	14,698,451,954	295,818	

The quantity of water pumped in 1895 was nearly the same as that pumped in 1888, it being but 2 1-5 per cent in advance thereof. The population of the city in 1888 was 194,996 and in 1895 was 266,544, an increase of 36 2-3 per

cent, showing an actual increase in the efficiency of the Works of over 34 per cent, that is, upon the basis of the per capita quantity pumped in 1888.

Consulting the table again, it will be seen, in the column headed "Per Family," that this quantity for each family has continually increased, which is the experience of every city in the world, where no restrictive measures prevail. Had these measures not been adopted in 1889 and continued thereafter it is a fact that this ratio of increase would have continued about the same.

This ratio of increase from 1852 to 1888 was on the average 12 86-100 per cent. The average ratio of increase for ten years previous to 1888 was 8 5-10 per cent. To avoid criticism, I will estimate that this ratio of increase since and from 1888 would have been 7 1-2 per cent. With this ratio of increase the following quantities would have been pumped, and consequently the difference between this estimated quantity and that actually pumped will be the amount saved:

SHOWING SAVING IN COST OF PUMPING.

					\$179.594 52	

The daily average quantity that would have been pumped in 1895 is 65,362,748 gallons.

The daily average that was pumped is 40,269,731 gallons. The daily per capita that would have been pumped is 245 gallons.

The daily per capita that was pumped is 151 gallons.

To show that this is not an exaggerated estimate, I submit these facts:

In 1888 the daily per capita of Detroit was 204 gallons, and considerably more than that of Buffalo, in fact it led the world. Last year Buffalo, which has not adopted any restrictive measures, pumped a per capita of 293 gallons; and it is not a stretch of the imagination to say that Detroit would undoubtedly have reached, if not exceeded, that figure had no change been made in the policy of the Board.

With this daily per capita, our daily average would have been 78,097,392, with a maximum, which we must always be prepared to pump, of about 115,000,000, to supply which would require two more engines than we now have and an additional force main.

The only possible criticism that can be made upon this estimate made of the saving in pumping alone, is in the taking the rated cost per million gallons in each of the past years and multiplying the increased pumping by it, because it is true that larger quantities can be supplied at a less cost per unit than smaller quantities. Taking off 15 per cent of the estimated amount in the table would fully cover this difference, leaving a saving of \$150,000.

The entire expenditures for the purchase, placing and repairs of meters from 1889 to 1895 inclusive, was \$133,-693.72.

The present valuation of the meters in commission and in stock, with a reasonable percentage off for depreciation occasioned by use, is \$94,289.39, showing that the actual expense for maintaining this department was \$39,404.33 for the seven years.

The saving effected in the cost of pumping is not by any

means the most important one. Large expenditures for machinery, engines, engine houses, force mains, supply mains, etc., etc., have been and always will be prevented by economy of use.

The large force main but now being completed, the new engine, the extension of the engine house, and various other enlargements, were demanded seven years ago. Had not the determination to restrict the waste prevailed with the Board early in the year 1889, these expenditures would have been entered into at that time, and to-day, instead of having a reserve power and capacity more than adequate for our every need, the Board would ere this have entered into another large extension of the Works, in which two engines, an engine house and a force main would have been necessary items.

That the increase in the per capita supply is not due to the increased number of factories and business places in the community, I submit the following table:

YEARS.	No. of Families Supplied.	Rates Received for all Purposes.	Average per Family.	REMARKS.
1876	20,102	\$205,624 74	\$10 28)
1877	20,845	210,288 12	10 88

1893	49,817	420,490 88	8 44	to 4 of a cost per
1894	. 49,912	418,728 76	8 89	100 gallons. Reduction from July 1,
1895	51,426	428,779 41	8 84	1894, in charges on fixtures.

For ten years previous to 1886, the rates received for family, business and manufacturing purposes, divided by the number of families supplied, gives practically the same quotient. During that period the same system of rates prevailed. From that time there have been several reductions, all of which, fully applied in 1895, reduced the average received from each family from \$10.25 to \$8.34, a difference of \$1.87, or a general reduction in the income of the Board for the year of \$96,166.62.

Previous to and during the first two years of the introduction of meters the average was to each family \$9.36. The reduction of the rates in 1891 subsequently reduced this average in 1895 to \$8.34, a difference of \$1.02 to each family, or a general reduction of \$52,454.52 in the income of the Board for the year.

I submit the following comparative statement, taking two years previous to the introduction of meters and the last two years. The actual operating expenses were caused by the increased price of oil and the increased number in the clerical force of the Works:

COMPARATIVE STATEMENT.

	1887.	1888.	1894.	1895.
Daily average consumption in gallons	86,079,068	89,897,716	87,896,656	40,269,781

*Estimated population	184,829	194,996	258,834	266,545

^{*} Population estimated by multiplying families in city by 5.14.

It will be seen that the per capita quantity pumped increased seven (7) gallons over that of 1894. In analyzing this increase I find that during the first six months of the year the per capita was 160 gallons and during the last six months it was but 143 gallons.

This excessive amount in the first half of the year was almost entirely occasioned by the extreme cold weather in January, February and March. The per capita in February was 192 gallons.

It will give some idea of the vast amount that was wasted at that time by comparing it with November, in which the per capita was only 119 gallons. The difference, 73 gallons per capita, or a daily average pumping of nearly twenty millions, was wasted simply to prevent fixtures from freezing.

It will be seen by the table, also, that for each 1,000 gallons of metered water was received 4 2-10 cents, and for each 1,000 gallons of unmetered water was received 2 7-10 cents. Eliminating from the unmetered water the 25 per cent representing the water used for public purposes, in lawn and street sprinkling, etc., which it includes, and the receipts for this usable quantity is 3 8-10 cents, or but four-tenths less than that for metered water.

I desire to call your particular attention to that portion of the Civil Engineer's report in which he treats of the necessity for more restrictive measures to prevent waste, than at present prevail.

His recommendation to purchase ten (10) of the Descon meters is one of which I most heartily approve. For two or three years past I have been familiar with the benefits to be derived from their use, but several things have conspired to keep me silent on the subject. The condition of our finances, I think, will now permit us to extend our restrictive measures in this direction, an outlay that will eventually save more than ten times the expense.

The Civil Engineer's treatise upon disease organisms, and the possibility of their existence in the water supplied the city, is of interest to all, and shows a considerable research in a field that is, comparatively speaking, known but little of except by scientists.

While the subject is certainly worthy of consideration, it is yet true that the existence of the evils described is, after all, largely imaginary.

We have a Board of Health in our city whose duties are to regard the public health from every standpoint, to not only guard the city from contagious diseases, but to know their source and cause and to prevent their propagation.

The Board of Water Commissioners has never received from the Board of Health any information, directly or indirectly, that the waters of Detroit River contain germs, either organic or inorganic, that are periling the public health.

I speak of this through a desire to prevent any material expenditure in this direction, unless circumstances demand it.

WATER WORKS BONDS.

The following table gives the results obtained from the assessments made last May and June, to commence July 1.

The total number of families in the city was at that time 51,857, which, multiplied by 5.14, the average number in each family, gives a population of 266,544. This average is obtained from the United States census of 1860, 1870, 1880 and 1890.

* Meter receipts from January 1, 1895, to January 1, 1896.

Now thereading the reduction of the rates which took where have the prevailing, of course, the entire year a 1992, the water races received were in excess of those of 1994, to about \$1.000.

The water is that will be received in 1896 will probably by it is seen at those of 1895 by about \$15,000, should be charge to made in the present schedule of rates.

cathemen, is respectfully submitted, to the inancial operations of the employers in Board, prepared at my request by the Auditor, which is not attached.

Yours, very respectfully,

L. N. CASE, Superintendent and Secretary.

CERTIFICATE OF AUDITOR.

L. N. CASE, Superintendent and Secretary:

Dear Sir—In accordance with your request, I furnish herewith a consolidated statement of the financial operations of the employees of the Water Board for the year 1895.

H. S. STARKEY, METER CLERK.

I have examined the accounts of the Meter Clerk, from January 1st, 1895, to July 1st, 1895. Meter bills amounting to \$41,946.94 were collected and same passed in full to Receiving Clerk.

J. E. LONG, PERMIT CLERK.

The total receip	ts from service	cocks, sleeves, v	alves
and plumber	s' licenses, from	January 1st to	July
1st, 1895, as p	proven by examin	ation of receipts is	sued,
was			\$2,781 45

Receipts from delinquent taxes were:

Year.									
1891-2		 	 	 		. \$	2 50		
1892-3		 	 	 		. 3	4 75		
1893-4		37	9 17		
								416	42
Total .		 	 	 	<i>.</i>			.\$3,197	87

The books of the Receiving Clerk show that amount above has been received in full.

ASSESSORS' DISTRICTS 1 TO 8 INCLUSIVE.

In addition to the monthly examination of the receipts of the eight Assessors, the result of which has been reported to the Board, I have made an examination of their assessment books for the year July, 1894, to July, 1895, making a careful analysis of the treatment of every assessment on the books.

I find the work of the Assessors remarkably correct, and furnish below a consolidated report of same.

J. A. M. MORETON, Auditor.

Detroit, January 2, 1896.

REPORT OF THE CIVIL ENGINEER.

Detroit, January 25, 1896.

To the Honorable Board of Water Commissioners of the Otty of Detroit:

Gentlemen—In compliance with the regulations of your honorable body, the Civil Engineer submits the following annual report for the year 1895:

The year just closed has, for several reasons, been a notable one in the history of our Works. Perhaps the event that will be viewed with the most interest by those conversant with the mechanical principles involved in the operation of water works and the hitherto accepted dicta regarding them, is the disconnecting of the stand-pipe June 2, thereby leaving this a direct pressure system in the simplest form. without reservoir, stand-pipe or balancing tank, dependent simply upon relief valves for protection against excessive variations of pressure. Ten years ago, and by many even now, such a proceeding would have been looked upon as inviting calamity, yet during the past seven months, under more severe requirements than ever before, the same engine that have served us from ten to twenty years have run on without interruption, and the testimony of their engineers is that even when two engines are running in one main. they operate more smoothly than while the stand-pipe was connected.

The year is further remarkable from the immense quantities of water consumed at various times and for its total consumption, which has exceeded that of any previous year. During 1895 the quantity of water recorded pumped by the engines has been 14,698,451,954 gallons, an increase of nearly 8 per cent over the quantity pumped in 1894. For

the twenty-four hours from 7 a. m., February 8, to 7 a. m., February 9, there was pumped 60,532,971 gallons, which is the largest quantity ever pumped here in the same length of time. On Saturday, July 6, between 5 and 6 p. m., there was pumped 2,981,934 gallons, which is the maximum amount ever pumped in a single hour. The last two statements give a key to the explanation of our increased consumption for the year, and its causes are to be found in the exceptional meteorological conditions which have existed at various times. A careful study of the fluctuations of our water consumption carried on during the past three years has shown certain relations which exist between temperature and precipitation and the demand for water. Briefly, the results of these investigations may be summarized as follows:

For a range of temperature from about the freezing point to about 50 degrees above zero, Fahrenheit, variations of temperature appear to exert no influence upon consumption, but any change above 50 degrees Fahr. will affect consumption, and it will increase rapidly as the temperature rises; and as it falls will decrease more slowly than it increased. Below 32 degrees Fahr. variations of temperature will affect consumption, which increases rapidly as the temperature falls, and decreases less rapidly as it rises, being unlikely to reach the normal until the temperature gets to be somewhat above the freezing point. Above 50 degrees Fahr. precipitation will have a sudden and very marked effect to reduce consumption, having in one instance decreased ours as much as 12,000,000 gallons in a single day, but below 50 degrees Fahr. it appears to exert no influence.

Considering the excessively cold weather of the winter months and the very hot, dry periods of the early summer in view of the above deductions, the addition to our consumption is readily explained. On the other hand, for no month since November, 1892, has so small a quantity of water been pumped as in the November just past, and the hourly records for those periods when our consumption is

least, from midnight to four in the morning, remain at as low a figure as they have been at corresponding times during the past three years.

The small extent of pipe laid of the smaller sizes, twelveinch and under, also distinguishes this year. While during the four years 1891 to 1894 inclusive the average quantity had in these sizes has been over 183,000 feet, during 1895 this wi, (a) feet were baid; and, finally, the construction of s in the firm man from the Works to town marks an epoch IL IN LEGIT IN OUR SYSTEM. This main is now nearing contribute materially Mill to miver our machinery from the severe strains to which was subjected by the excessive demands of the past and raise the head in those districts where its in a most needed. It was discovered last July, at hen our engines were pumping nearly three was realises per hour, that the frictional loss amounted the per cent of the work done by the engines. When million gallons per hour the frictional loss was 2: 34 per cent. It had already been found that two-. It is frictional losses occurred in the two forty-twomains. Therefore, with the third main in serwe may expect that the resistances in the force mains whom delivering three million gallons hourly will be the as at present when delivering two million gallons, or wantering two-thirds of the above percentages, the new main will reduce our frictional losses from 34.4 per cent to I her cent of the total work done. This will mean on the average about a three-pound increase of pressure over the withre system, being somewhat more in the eastern part and has in the western.

the afternoon of July 6, when the maximum quantity of water was pumped, an investigation was made of the condition of the distribution in the district between Canfield are not the North Boulevard from Cass avenue west, which district the sixteen inch main laid in 1894 was intended to relieve. The examination, which extended over

nearly 7,000 feet of territory from south to north, being at right angles to the supposed direction of flow, beginning at a thirty-inch main and terminating at a twenty-four-inch main, including eleven pressure readings, showed that the variation of total head across the district was only two and three-fourths feet, and the smallest usable head recorded was nearly twenty-eight feet. It may be of interest to compare the pressures existing at the time of this investigation, which was at a time of most severe demand upon the distribution, with those of eight years ago, as follows:

•	1888.	1895.	Gain.
Canfield ave., from Cass to Third	11½ lbs.	18 lbs.	56 ≴
Hancock ave., from Cass to Third	9 lbs.	15 lbs.	66 % ≸
Warren ave., from Cass to Third	9 lbs.	14½ lbs.	61 💉
Putnam ave., from Cass to Third	8¼ lbs.	14 lbs.	69 🖋
Holden ave., from Cass to Third	8 lbs.	12 lbs.	50 🖇

Increase of head at engines, about 30 per cent.

From this it is seen that for each pound pressure added at the engines the consumers in this locality have had two pounds extra delivered to them, and very similar results might be shown elsewhere in our system.

Early in the past season some discussion took place regarding the quality of our water supply and the advisability of moving the intake from its present location to a point further up the river. As there appeared to be no reliable information then at hand that would aid in settling the questions raised, your engineer was requested to investigate, as far as possible, into what might be the sources of present and future contamination likely to affect our water supply, and what remedies or preventives might be applied. Since that time an extensive study has been made of the recent literature bearing upon the subject of water pollution and the treatment of polluted waters. A visit was made to the Lawrence Experiment Station, conducted by the State Board of Health of Massachusetts, where since 1886 there have been carried on the most careful and extensive experiments and investigations on water purification that have yet been undertaken anywhere in the world.

So far as chemical analysis is able to determine, our water compares most favorably with that of any public water supply in America, which fact has been frequently commented upon, and considering the inert matters only it may be said to contain nothing at all likely to prove disagreeable or deleterious to public health. Fifteen years ago to have said this would have been saying that the water was as near perfection for domestic purposes as any water known, but the developments of more recent investigation have proven that chemical analysis alone can afford no criterion of the healthfulness of a drinking water, and that the mineral matter and the dead organic matter which such a water contains are entirely harmless to the extent to which they ordinarily occur, while it is to the presence of certain minute living organisms, now believed to be the true germs of many diseases, that the harmful effects of some waters are due. These organisms are so small, many of them, that even the microscope is unable to distinguish them, and it is only by delicate and special methods that they can be identified. Organisms of this sort are found in all surface waters, and very frequently, if not always, in even very deep well waters. Fortunately for us, not all, nor even a large percentage of them are harmful. Of those which grow and thrive in ordinary waters none are known to be dangerous. but there are varieties not indigenous to the water, but which are capable of living for a greater or less period of time in it, that are disease producing. Such, for instance, are the germs of cholera and typhoid fever. These germs are given off in the dejects of those afflicted with these diseases, and if they are permitted to mingle with sewage which finds its way into a stream farther on used as a water supply, the disease may be thereby transmitted. As the former of these diseases is little feared in America, only very limited investigations have been carried on regarding it here, but in Europe it was clearly and conclusively proved that the terribly fatal epidemic which visited Hamburg in 1892 and 1893 was caused by the transmission of cholers

germs through the water supply. Typhoid fever has been much more extensively studied, and though it is an old theory still maintained by some that it is caused by an environment imperfectly ventilated and drained, the bulk of authority, though admitting that imperfect sewerage and bad ventilation in his surroundings may and often do tend to render the subject particularly liable to infection, maintains the conclusion that typhoid fever is not in the original case produced from such causes. The most frequent sources of typhoid infection in those localities where especially thorough and painstaking investigations have been carried on are water and milk supplies. In one noted case raw oysters were proven to have caused the disease, and uncooked vegetables, such as lettuce and celery, have been looked upon as possible agents for its conveyance.

In considering any water supply it is therefore necessary to ascertain whether it is possible for the dangerous or pathogenic bacteria to gain access to it and whether their vitality is such as to enable them to live until they have traversed the distance between the source of contamination and the consumer of the water. To this end some knowledge of their life is needed. The typhoid bacillus has been perhaps more extensively studied than any other, and its term of life in Merrimac River water at Lawrence was found to range from ten to thirty days, the average period being about fifteen days, while in the purer effluents of some of the filters it appeared to be somewhat longer. There is excellent proof that typhoid germs traveled thirty-nine miles in the Merrimac River, over mill dams, through rapids and almost stagnant mill ponds, the last thirteen miles being affected by tide water, and after passing through pumps and water mains caused an epidemic among the water consumers, and there is abundant evidence of their similar transmission over shorter distances.

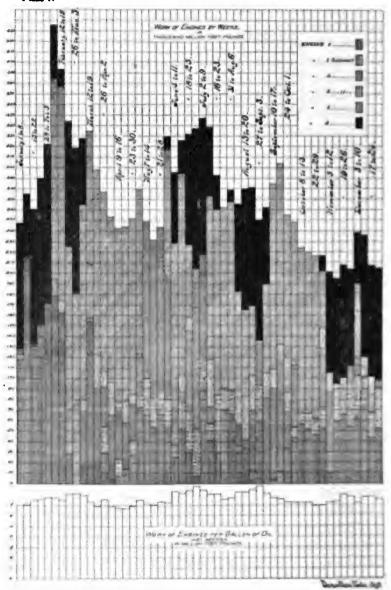

In view of these facts, a consideration of the quality of our water supply must include the investigation of all sources from which such contamination can reach it. The most likely sources of typhoid infection of Detroit River water are the sewage discharges of the cities above us on St. Clair River. Port Huron being the largest of these, and the most of a city in its appurtenances, delivers the greatest quantity of sewage into the river, but its distance being so great, about sixty miles, it hardly seems probable that it can have much direct effect upon the water at Detroit. Yet St. Clair. Marine City and The Flats, as well as other towns, take water from St. Clair River and Lake St. Clair below Port Huron. and discharge their sewage into the same waters. It may, therefore, be possible that typhoid germs starting at Port Huron should cause disease at St. Clair, and from there be transmitted by stages to our intake. A more dangerous, though less constant, cause of pollution is found in the discharges of sewage from passing vessels, and viewing these two warres of contamination alone, it does not appear that any advantage would be gained by moving the intake up stream from its present location. The writer does not wish to be understood as saying that there is any proof of a single case of typhoid having been caused in Detroit from the above sources of infection, but is only pointing out a possibility. Another source of pollution, and the one most commonly considered, is the discharge of Connor's and Fox Creeks and several county ditches entering Lake St. Clair within three miles of the intakes. Of these, Connor's Creek is the largest and the nearest at hand, being only about one mile from the suction cribs. The drainage area of this stream and the ditches near it is about fifty square miles, with about 5,000 inhabitants, or 100 per square mile. Were such a population on the watershed of an impounding reservoir where water was stored for a considerable period before use. it would not be considered particularly dangerous. The Fox Creek watershed and the lake shore within Wayne County adds about twenty-five square miles more, having probably not to exceed eighty-five inhabitants per square mile. Being so sparsely settled, it does not seem likely that serious contamination could reach us from these sources, except under particular conditions. Thus far there are practically no sewers emptying into these streams, and at periods of ordinary flow it seems very doubtful if the waters of Connor's Creek, at least, can become sufficiently mingled with those of Detroit River, in the short distance they have to flow, to reach our intakes. It is only at times of heavy rains and the melting of snows that much dangerous matter would be at all likely to gain access to these streams. acter of the soil in this vicinity renders it extremely likely that at such times the water would reach these channels mainly over the surface, carrying with it whatever it found in its way, and at such times the higher velocities of the currents certainly causes these waters to mingle more thoroughly with those of our river, and undesirable matters may thus reach our intakes. There is very little chance for the water to improve in passing through our system, for ordinarily in less than twenty-four hours from the time the water enters the suction crib it is delivered to the consumer. That fevers apparently of water origin are often quite prevalent after heavy rains following periods of drouth, and after spring freshets, has been noted by some of our physi-In view of this, it seems to your engineer that your honorable body should exercise a careful surveillance over these tributary waters and use all possible influence to prevent them from becoming the receptacles for sewage from any sources, particularly the villages on their watersheds. The Act of Incorporation of the Board of Water Commissioners provides, in Section 21, that your honorable body may exercise authority over the waters of Detroit River and Lake St. Clair within six miles of the intakes, to prevent pollution, but considering the facts already pointed out, this is not sufficient to insure our water supply from contamination as the populations above us increase. Whatever the conditions now, in the more or less distant future Detroit will be forced to follow the example of the European cities having surface water supplies and purify its water before delivering it to the consumer. It is to be regretted that we have no reliable analyses furnishing us a clue to the true composition and contents of our water, and I would respectfully urge the advisability of having frequent biological and bacteriological analyses made by a reliable authority, as such a method would afford us most readily with information from which the true condition of affairs could be appreciated.

Whether our supply be now infected or not, it must be apparent that the existence of such conditions as are discussed above should admonish us to lose no time in endeavoring to reduce to a minimum the useless consumption of water, for aside from the bearing upon the present cost of operation, the cost of purification varies almost directly with the quantity purified. The subject of the restriction of waste is an old one in these Works, and much has been already done in that line, but much more, and the hardest part, remains to be accomplished before the consumption can be brought within those limits which present practice holds to be sufficient for all necessities. For the past three years your engineer has been devoting much attention to the consideration of this subject. Hourly records of the quantity of water pumped and the pressures maintained have been furnished this office since May, 1893, and from the reports furnished us by the Fire Department we have been able to obtain a reasonably accurate determination of the quantity of water used at fires for the entire year just Memoranda collected by our own Meter Department give us the amount of water used for manufacturing and business purposes, which is checked by the difference between weekday and Sunday consumption. By applying the rules already laid down for temperature and precipitation effects, under some conditions it is possible to determine the quantity of water used for lawn and street sprinkling, preventing freezing, etc., with fair accuracy. oughly discuss the subject of waste would require an amount of space far beyond the compass of this report, but it is possible to outline some of the methods of determining the various quantities desired. The month of November may usually be considered a normal month, there being ordinarily no demand for water either for lawn and street sprinkling or to prevent freezing. With the fire consumption and that for manufacturing and business purposes determined and subtracted from the total quantity pumped, the remainder represents domestic consumption, waste and leakage. November, 1895, furnishes the following information:

Average daily per consumer domestic consumption, waste and leakage...... 98.87 gals.

From observations of the Meter Department, compared with our revenue statistics, your engineer determined that the average necessary daily domestic consumption would be about twenty-two gallons per consumer. If this figure should be correct, the waste and leakage must amount to 76.87 gallons per consumer daily. All will admit that during the hours from midnight to four in the morning the consumption of water in a city of even this size should be Now, the smallest quantity comparatively insignificant. pumped in a single hour in the past two years was between twelve and one o'clock on the morning of November 11, 1895, and amounted to 832,525 gallons. This is at the rate of nearly 20,000,000 gallons daily, or 76.4 gallons per consumer. This must be nearly all waste and leakage, and coincides very closely with the 76.87 gallons obtained above, and gives proof that the estimate of twenty-two gallons per person for domestic needs was very nearly correct. The average daily consumption for the past year has been about 40,250,-000 gallons, and of this we find that almost 20,000,000 gallons are being wasted at that time of year when there is the least cause for waste to occur. Or, considering the month

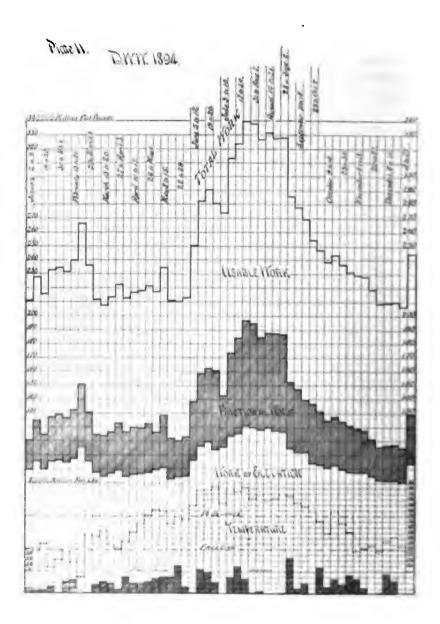

Plac!

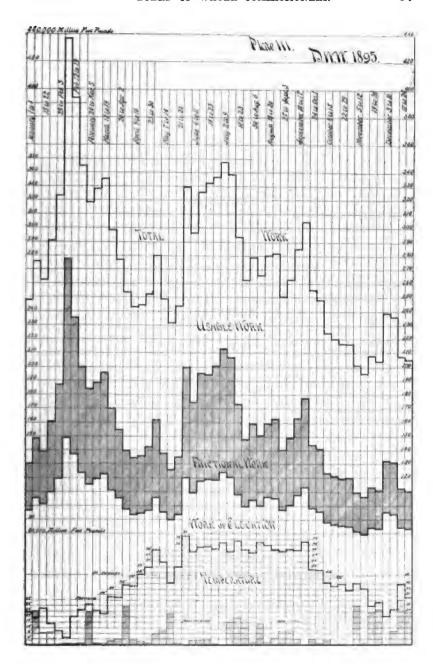

November alone, over 60 per cent of the water pumped appears to be serving no useful end. In the month of February the total daily consumption per consumer was 198.3 gallons. The average daily metered and fire consumption was twenty-two gallons, leaving 176.3 gallons for domestic uses, waste and leakage. During the maximum day the quantity used was at the rate of 234.6 gallons per consumer, of which the minimum hourly night rate was 223.3 gallons daily. In July the daily consumption per consumer was 168.2 gallons, of which 23.4 gallons were metered and fire consumption. Taking the year as a whole, the records of this office give the following information regarding consumption:

	Yearly.	Daily. d	Daily, per Consumer

In common language, allowing as free use of water for lawn and street sprinkling and to prevent freezing as was indulged in during the past year, and considering all as useful consumption, with all that used for business, manufacturing, schools, fires, public purposes and domestic needs

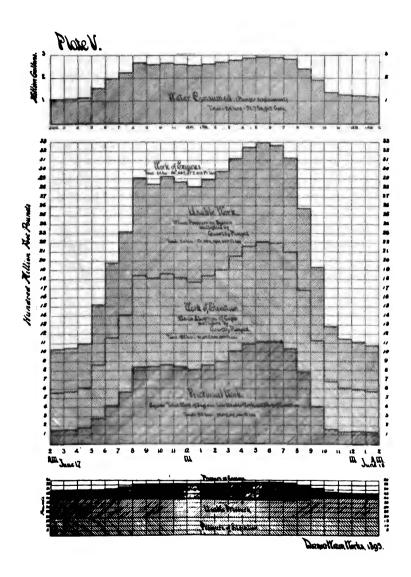

added, for every gallon so usefully consumed more than one and one-tenth gallons ran to wasts. If any of the water so consumed were usefully employed, no effort should be made to restrain its use, but as no advantage can possibly accrue to anybody from the pumping to waste of this great quantity of water, decisive measures should be taken for its reduction. When the method can be applied, none is more effective in reducing waste than the application of meters to the service pipes of the consumers, but in our system this work is not keeping pace with the growth of the city. During 1895 there were nearly two and one-third times as many new connections added as there were meters set. Out of 48,918 connections now in use only 3,775, or less than 8 per cent, are metered. That some more comprehensive means of accomplishing the desired result must be found is, therefore, apparent. The most satisfactory method of dealing with the problem in hand thus far produced is by the aid of the Deacon Waste Detection Meter. This is an instrument which is set in the main, and mechanism operated from a clock records on a chart the quantity of water passing it at any moment. The mode of operation is to shut off the district to be examined, so that all water flowing into it must pass the meter. The observations are ordinarily conducted between midnight and four in the morning. The inspector goes through the district shutting off the service connections and side lines and recording the time each gate or By comparing these memoranda with the valve is closed. chart of the meter the amount of waste at each connection and in each street main is shown. The inspector is then possessed of the information regarding the location of the waste and all that remains is to see that the defective fixtures are repaired and the leaks in the mains stopped. On the application of this system in Boston, in a district containing a population of 21,760 persons, the consumption was reduced from 58.5 to 37.7 gallons per capita daily, a saving of 35.6 per cent, the night consumption being reduced 58 per cent. Similar results have attended the use of these meters in Philadelphia and in many cities in England. The cost of the meters set in place in Boston was about \$400 I would respectfully recommend to your honorable body that ten of them be purchased and set in our system at points to control those districts in which excessive waste and leakage is most to be expected. great advantage of using these meters over ordinary inspection is that the inspector's time is not taken up in visiting premises where there is no waste and the residents thereby uselessly annoyed, but he is able to devote his whole attention to those which need it. If our consumption during 1895 had been reduced only to 100 gallons per consumer, or about 35 per cent, the saving in fuel alone would have been over \$13,000, or more than 40 per cent of the entire fuel bill, the same pressures being maintained on the system,

In a city having so many miles of electric railway in operation as this it may be anticipated that trouble will be met with from electrolysis. This subject has been very extensively studied in and about Boston, but in spite of the pains taken with the investigations, the results thus far have failed to resolve the preventing of electrolytic effects in general into a soluble problem. It has been, however, observed that very small currents-even with as low a potential as 0.002 volt—are capable of producing dangerous effects, and that the constituents and amount of moisture in the soil appear also to have an important bearing on the case. While it has been frequently attempted in Boston to locate points of electrolytic action, and many excavations have been made to find the effects of it, none have resulted in the discovery of anything definite or conclusive in the matter. The most that can be said is that certain conditions tend to produce certain effects, but these effects are not always apparent in the presence of the conditions. garding our own system, we know that so far as the electric currents are concerned we have all the conditions required to produce electrolysis in our pipes, but thus far we have found no direct evidence that our mains are affected.

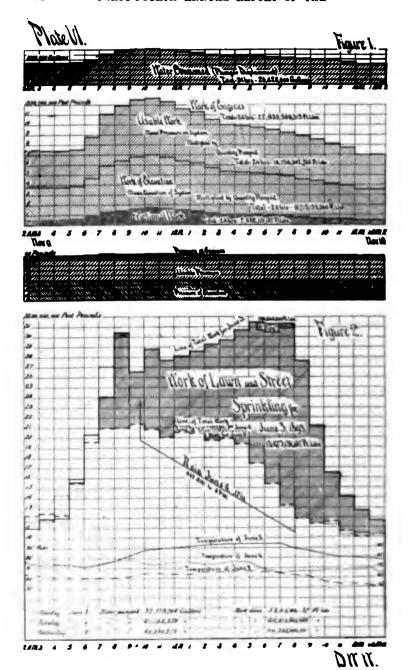

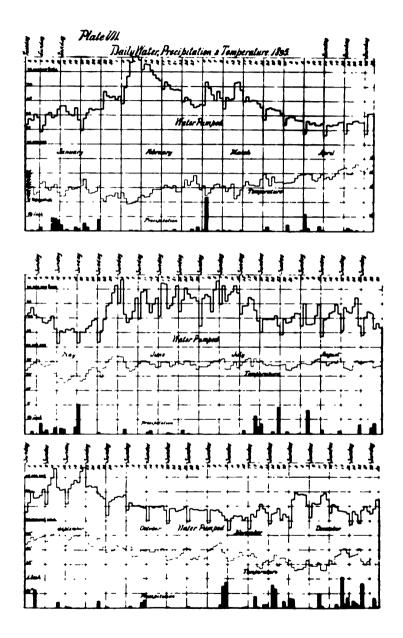

most natural explanation is that the requisite constituents are lacking in our soil to produce the necessary chemical combinations, or it may be that the waste in the system being so great, a means of waste detection will be necessary to determine the location of electrolyzed pipe, even after the damage has been extensive. The study of the subject is one for the specialist, and so long as no general remedy is known, it does not seem wise to spend time or money in searching for a trouble which must, with our present knowledge, be treated as an individual case each time, and which, if serious, must finally manifest itself.

As shown in the report of the Chief Engineer of the Pumping Station, the efficiency of our machinery has been about 16 per cent higher than last year. This is due to at least three causes: First, the economy of Engine No. 4, the Allis engine, which has done 20 per cent of the work this year, thereby saving us about 7 per cent of the cost of pumping; second, the improvements to Engines Nos. 1 and 2, which probably account for about 6 per cent more; and, third, the increased head numbed against, allowing a more economical use of steam, probably accounts for the remaining 3 per cent. The effect of the running of Engine No. 4 is clearly shown on Plate I., page 54, where the work done weekly by each engine is represented in the upper diagram, and the quantity of work done per gallon of oil burned weekly is shown on the lower diagram. A correction has been applied to the quantity of oil used to allow for the lighting, but no correction for the heating of the buildings has been made. It will be seen that whenever Engine No. 4 does a fair percentage of the pumping there is a decided increase in the work of a gallon of oil. This plate also brings out the increased economy as the total quantity of work increases, which occurs with increasing head.

It was hoped at the beginning of the year that the new force main might be completed in sufficient time to enable the distribution system to show a corresponding gain, but this has not been the case. In consequence of the increased consumption of water the work of the distribution shows a decrease of efficiency of about 4 per cent, leaving the net increased efficiency of the system as a whole 12 per cent, and, as before stated, two-thirds at least of this loss was due to the force mains being too small. The work of the system as a whole for 1894 is shown on Plate II., page 56, and that for 1895 on Plate III., page 57. These plates are made to the same scale, and the difference in the demands made at various times upon the system are at once apparent. ticular attention is called to February and June. Plate IV., page 60, shows the work of the system by hours for the day of maximum consumption, February 8, and Plate V., page 61, the same for June 17, which was a day of very large hot weather consumption. While in the former there were pumped nearly nine million gallons more water than in the latter, from the concentration of the demand into a few hours it is clearly seen that the summer day made by far the more severe tax upon the machinery and distribution. Under normal conditions, as shown in Fig. 1, Plate VI., page 64, the consumption and the work falls off gradually after reaching its maximum between nine and cleven o'clock in the morning; but in the case of summer consumption the area included in the hump of the diagram from noon until eight p. m. represents work consumed in lawn sprinkling. quantity of water so used on June 3 last, as may be seen from an examination of Fig. 2, Plate VI., and of Plate VII., page 66, was 12,000,000 gallons, being nearly 25 per cent. of the entire daily consumption. In the former diagram the quantity of work expended for lawn and street sprinkling and cooling purposes on that day is represented by the dark area and was obtained in the following manner: The temperature for June 3, as shown by the full line in the lower part of the figure, was exceptionally high and as will be seen by reference to the middle diagram of Plate VII., page 64, followed a week of very hot, dry weather, this being in fact the hottest week of the year. The work of the engines by hours for June 3 is represented by the area enclosed by the

full heavy line of the diagram. June 4 opened with higher temperature and increased consumption, as is shown by the dotted lines of temperature and work, but at 9:45 a.m. rain began to fall. The effect of this was presaged by the sudden decrease of the demands upon the engines after 8 o'clock. The rain continued until 8 p. m. of that day, and though the total precipitation was less than one-quarter of an inch. it was accompanied by a fall of temperature from a maximum of 96° on the third to a minimum of 50° on the morning of the sixth. The work of the engines for June 5 is represented by the area below the broken line bounding the It seems clear that the only uses of water likely to be affected by a rain and such a fall of temperature are those for lawn and street sprinkling and cooling purposes, and hence any decrease of consumption or work at such a time must be due to a cessation of these uses. It will be at once appreciated that not all the water so used was shut off. but whatever difference there is between the consumption of June 3 and that of June 5 that is not accounted for by incidental causes, as fires and the day of the week fluctuations, may be fairly ascribed to the causes under consideration. Making corrections for the work caused by the fire between 5:30 and 8 p. m. of June 3, shown by the area marked "Fire," when four engines were in service, and for the usual nightly variations between Sunday and week nights, the diagram shows 13,475,131,167 foot pounds, or more than one-third of the average daily work for the year, and nearly two-thirds of the work of the day of minimum consumption (shown in Fig. 1, Plate VI.) as due to these The use of such a quantity of water at times when every additional gallon means the bringing of our machinery so much nearer to the limit of its endurance leads to the consideration of whether some means of regulation bearing upon it should not be introduced. It is certain that the use of water for lawn sprinkling without charge has led to considerable abuses. It is not an uncommon thing to see a hose running with full head, the nozzle lying on the

sidewalk or thrust into a crack between the boards. Such waste of water is almost criminal. Upon the right means to apply in the solution of this problem it is hard to decide, but something should be done. A considerable relief might be obtained by restricting the size of nozzle used and limiting the minimum length of hose. If the lawn sprinkling could be confined to the night, the draught on the machinery would be much reduced and the lawns improved as well, for it is a wise provision of nature that veils the sun at times of rain. As things are now, should our lawn sprinkling continue to increase for another year as rapidly as it has done in the past, we will be forced to purchase additional machinery to meet this demand alone, while if it be properly controlled, even though other causes of waste be not abated. the present machinery may be relied upon to do our work for several years to come. This system having no reservoir to fall back upon in times of accident or emergency, must always have an extra engine to put into service. In the ordinary course of operation one engine is necessarily undergoing repairs, so that only three can be in commission continuously, of which one should be in reserve. times during the past summer when three engines running, and at their maximum capacity, were required for the afternoon demand, while the fourth was in need of repair. cause for several years no accidents to our machinery have occurred, we must not forget that we are continually running greater risks as age and service weaken the machinery and corrosion deteriorates our pipe, while the demands of our population lead us to each year crowd more closely what must be the limit of safety. Plate VII., page 66, shows the effect of temperature and precipitation on the daily consumption, and from this and similar plates for the preceding years the rules for their effects have been deduced.

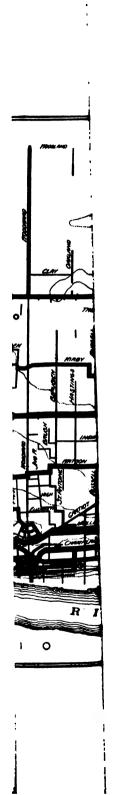

The work of the draughting room has been continued as formerly, and a vast amount of very valuable information has been added to our records. The territory between Mt. Elliott avenue on the east and Campbell avenue on the west

is completely platted by street intersections, and in many cases not only our own work, but all other underground construction is shown. The keeping of the records of construction in the field by a representative of the Engineering Department has been highly satisfactory, and much more reliance can be placed in the records so kept than in those furnished by the former system of foreman's reports.

In closing this report, I wish to express my obligations to the Inspector in charge of the Local Station of the United States Weather Bureau, to the United States Engineers' Office, and to the several city departments for courtesies and valuable information, and to my associates in the service of your honorable body for their hearty assistance and co-operation and friendly advice during the past year.

All of which is, gentlemen, very respectfully submitted.

G. S. WILLIAMS, Civil Engineer.

REPORT OF SUPERINTENDENT OF METERS AND INSPECTION.

Detroit, January 2d, 1896.

To the Board of Water Commissioners:

Gentlemen—In compliance with the rules and regulations of your honorable body, I herewith report the work done in the meter, inspection, service cocks and repairing leaks departments during the year 1895.

The following table shows the number of meters placed during the year and the total number in service on the 31st day of December, 1895:

				1	SIZES	1			
	% in.	34 in.	1 in.	13 % in.	2 in.	8 in.	4 in.	6 in.	Total

In presenting this report to your honorable body, I do so fully believing that the money expended in the meter department will prove to have been a wise and profitable investment for the Works.

We have placed 589 meters during the past year, 529 of them at the request of the consumer, showing that the meter is becoming a great favorite with water consumers. The total number now in use is 3,775, and the quantity of water pumped daily, when compared with that of six or seven years ago, will show what they have accomplished in the way of stopping waste. Although the per capita consumption has been reduced from 210 gallons daily to 144, yet it is much too large, and it could be lowered to seventy gallons at least without interfering with any of the legitimate uses. When the weather is not excessively hot or cold, the quantity pumped is not much over 100 gallons per capita, and with all plumbing in proper condition, it ought certainly to be kept at that point during that portion of the year when the heat does not call for a greater consumption.

An apartment house containing twenty-four families, with all modern water fixtures for domestic purposes, consumed an average of thirty-four and one-half gallons per capita daily during the last year. Another, containing six families, with modern fixtures (no washing done in the house, but quite a liberal use of hose), consumed only twenty gallons, showing that the present average consumption throughout the city is still excessive.

The objection is sometimes raised that such a low consumption would tend to produce disease, as the sewers would not be properly flushed, etc., but results in this and other cities that are largely metered does not bear out the claim. For instance, the death rate per 1,000 in this city in 1889 was 17.40 with no meters in use, while in 1895, with about 7 per cent of the service connections metered, it was only 15.80, showing a gradual decrease in the death rate, as well as the quantity of water consumed. In the City of Providence, R. I., in 1893 they had 17,417 service connec

tions and 12.088 meters, which shows that a little over 69 per cent of their service connections were metered. death rate per 1,000 for that year was 20.92. In 1894 they had 18,152 service connections and 13,153 meters, making over 72 per cent of their services metered, and a death rate of 18.72, showing a decrease in the death rate and an increase in the percentage of metered services. They are placing about 1,000 meters each year in Providence, and their death rate in 1889 was 19.76 per 1,000, and in 1890 it was 21.77, which was the highest point reached, and then falling gradually to 18.72 in 1894, which was the lowest point reached in several years. They pumped in 1893 sixty-one gallons daily per capita, and in 1894 sixty-two gallons. In the City of Buffalo, with no restrictions, they pump about 300 gallons per capita daily, and have a death rate of about 17.34 per 1,000, while Detroit pumps about 144 gallons, and had a death rate in 1895 of 15.80. The average death rate in thirty-seven of the principal cities in the United States for the year 1894 was 19.22, with less than 10 per cent of the service connections metered. And when compared with Providence with a death rate of 18.72 and 72 per cent of their services metered, it would seem as though the use of meters, although largely reducing the consumption of water, does not affect the health of the community in which they are In other words, "stopping the constant running of small streams into the sewers does not create disease."

One source of great waste we have to contend with is the closet when placed where there is danger of freezing. The different appliances, or patent valves, that are being used for the prevention of frost in such cases are failures to a large extent, that is, so far as stopping the continual flow of water is concerned, as they are placed down in a vault and usually in an unhandy place to get at, they very soon get out of order so they will not operate, and allow the flow of water continually.

In order to reduce his water rates (which were \$16 per year) the owner requested us to place a meter on a small

double house of his containing two families, with no water fixtures excepting sinks in kitchen and closets such as spoken of. The results of two months were somewhat startling to the owner. In November and December the average quantity consumed was 9,172 gallons daily, which would amount to nearly \$120 per year. The estimated rates had been paid to January 1st, but from that time he will pay the meter rate, and, unless the closets are repaired, instead of making a saving, he will have to pay very nearly as much in one month as he formerly paid in a year, as such leaks never grow less without being repaired, the tendency being to increase until they get to the full capacity of the service pipe.

We have nearly 49,000 service connections in the city, and should every one of them waste the same quantity, there would have to be pumped into the mains about 450,000,000 gallons daily, which is four times the capacity of the works.

There are many such closets in the city, and on which meters should be placed. We have not forced meters on private houses only in a few cases, where pleading or a threat did not have even a temporary effect, but I should think it wise to place meters on all connections where such closets are attached, whether in private families or not.

The consumption in most of the charitable institutions The city pays \$1,000 per year for seems to be excessive. the supply of water to such institutions, and during the past year they have consumed 117,929,250 gallons, a quantity which at the regular rates would amount to over \$4,000. There ought to be some restriction on the waste of water in such places. As long as there is paid a fixed sum for them they ought to be limited to a fixed quantity (large enough for all reasonable purposes) and over which they should pay It is hardly among the probabilities that the regular rates. any of them would be obliged to pay anything additional, as there would then be an object in stopping the waste, and that being done, they would easily keep within the prescribed quantity.

The cemeteries also consume an unreasonable amount, for which they pay nothing. It would seem as though—while the water is furnished them without charge—they should show a reasonable disposition to not be wasteful in its use, but when the consumption at Elmwood is 16,806,000 gallons (amounting to \$569.20) in one year, and at Mt. Elliott 3,162,750 gallons (amounting to \$114.42), it looks as though very little attention was paid to the matter.

The rule allowing the free use of hose for lawn purposes on metered connections (as spoken of in my last yearly report) still continues to cause trouble in drawing the line where the free use shall stop and the charge begin. stance, we have not considered a strip of grass two or three feet wide between the sidewalk and curb a lawn, and have required such hose connections to be placed on outlet side of meter, and in doing so have caused the consumers to claim that they have been discriminated against. sumption in such cases (while confined strictly to the lawn) would be trifling, but the principal use of hose on such premises is for watering the street, and not only that, the careless use of it adds largely to the waste, as it is often thrown down and the water allowed to run for hours until it forms a rivulet in the gutter and finds its way to the We allowed a hose connection free on a certain sewer. place last summer where they had a large lawn, and also a livery stable, in addition to two residences. We had reason to think the occupant was trying to get the best of us, and therefore kept a watch on the premises, and were not long in finding that he had supplied himself with about seventyfive feet of hose, which he attached to the free hose connection and carried it to his barn, where he used it for washing his carriages, watering horses, etc. He was forced to remove the hose connection to outlet side of meter, and after that he had some hose for sale. We have had several similar cases to contend with, and, as I before stated, it causes much trouble and annovance in deciding just where to draw the line between a metered and unmetered hose connection. I should think it advisable on metered premises to have all water pass through meter, even though the meter rates should have to be reduced, or some reduction made in estimated rates, where every water taker would receive a benefit and have every hose assessed.

The expenses of caring for meters increase each year, owing to the steadily increasing number in use. On account of the intense cold during a large portion of last winter, we had many meters frozen, and thereby adding somewhat to the cost of repairs. Where meters were frozen through the carelessness of consumer, and all of those placed at request of same, the cost of repairs was charged to them and collection thereof enforced. With few exceptions the damage is repaired at the cost of two or three hours' labor, no new material being required.

We have formerly estimated the life of a meter to be ten years, but with our present experience think it will be much longer, as we have tested quite a number that have been in service nearly seven years, and in ordinary service they show but little wear. When they have been doing a large amount of work, that is, running up to their full capacity, the gear train shows evidence of wear, and in some instances have been replaced with new, but at a trifling cost, and even though the whole measuring chamber should have to be replaced it would only be at an expense of 20 per cent of the cost of the machine, and when this is done it is to all intents and purposes as good as new.

During the past season we have been obliged to replace some of our wooden meter wells (that were built six years ago) with brick. The wood begins to show evidence of decay, and when they are outside of the line of lot we are obliged to replace them with brick, as the Board of Public Works allows no more wood used for meter wells. We have at the present time 996 meter wells; 816 were built by us and 180 by the consumers; 781 of our wells are of wood and 35 brick. Consumers have 155 wood wells and 25 brick. At the

present time, nearly all the wells that are required are built by the owner of the premises on which the meter is placed, so that hereafter our greatest expense in wells will be to repair those already built on premises where we forced the meter.

INSPECTION.

The leak examiners have made 55,834 examinations during the last year, and reported 4,482 leaks, 3,948 of which were repaired within the time given for same and 534 were ordered shut off for failure to make the necessary repairs.

The percentage of leaks to number of examinations made was 8.02, being an increase over the previous year, when they were 7.48. The only way to account for the increase is in the larger number of old service pipes of light and medium weight lead which have been in the ground for years. At the time they were put in, the pressure on the mains was much lower than at the present, and they answered every purpose, but with age and increased pressure they are now giving away rapidly, and it will require the strictest attention on the part of the examiners in order to keep the leakage from this source within the present bounds.

Much waste is wilful and no amount of persuasion or force can stop it. In case the water is shut off for wilfully letting it run to waste, the occupant makes all manner of excuses and promises, and succeeds in having it turned on, to have the very same thing occur again, and it is almost impossible to stop it other than by placing a meter on the premises, a remedy that is always successful.

The examiners, in addition to the foregoing work, are occupied from ten to twelve days each month in reading meters and delivering meter bills.

SERVICE CONNECTIONS.

Fourteen hundred and twenty-seven service connections were made during the past year, consisting of 730 five-eighths-inch, 606 one-inch, 44 two-inch, 19 three-inch, 24

four-inch and 4 six-inch. Sixty-eight were discontinued, making the total number of service connections in use January 1st, 1896, 48,918.

In addition to the above we have inserted 334 five-eighthsinch and 237 one-inch service cocks for the iron pipe department on streets where the old mains had been removed and
larger ones put in their places. In such cases we have been
obliged to connect all of the old service pipes to the new
mains, making a total of 561 service cocks inserted for the
department. All of those removed were of the old drive
cock pattern and could not be used again, as all service cocks
are now tapped in—that is, being inserted with a thread or
screw instead of being driven in after the hole had been
drilled, as was formerly the custom. There are about 1,100
pounds of the old cocks, which are composed of brass and
can be disposed of for whatever such metal is worth.

There were 637 less service connections made last season than the year previous, accounted for by the number of wood logs taken out in that year, on which there were 603 service connections. At the time they were put in the Water Works issued a permit, without charge, to tap the wood pipe, as the plumber made the connection and furnished the service cock himself, but when the wood was replaced with iron it necessitated new service cocks and the labor of inserting them, for which the owner of the premises was obliged to pay, and as a large number of wood logs were removed that year (in fact, the last that were in service) made more than an ordinary number of service cocks inserted.

The following statement will show the receipts and disbursements in the service cocks department during the year 1895:

Receipts for service cocks\$	5,102	50		
Receipts for plumbers' licenses	559	45		
Receipts for labor and material	301	57		
			\$5,963	52
Total expense service cocks department\$	10,909	16		
Less labor of inspectors	5,016	00		
		—	\$5,893	16
Balance to credit of service cocks		\$	\$70	36

INSPECTION OF NEW WORK.

The inspectors have given strict attention to the work in their department during the past year, so much so that they have become a terror to a few of the plumbers who in former years were inclined to cover up some portions of their work before being examined, fearing that it would not pass inspection.

This work has been increased of late, as they are now obliged to shut off all vacant houses, and also let them on when reoccupied, and report to the Assessor of their district the facts for a new assessment. It makes many additional calls for them and necessitates many long drives, especially in the outlying districts. They are also still busy preparing their new record of service connections and locating stop boxes. What was said last year on this subject will bear repeating: "The inspectors have devoted much time to locating and making a record of all stop boxes. They are taking new measurements, as there has been so much changing and subdividing of lots since the beginning of our record that in many instances we find the location not properly recorded, and when the boxes happen to be covered up it takes much valuable time to find them, especially so in case of a bursted pipe. It necessitates the utmost vigilance to keep the boxes exposed to view. being repaired, new ones built, or change of grade in street, alley or lot, the tendency is to pay very little attention to the stop box, and it is usually covered up, as the majority of property owners can see very little use for it until there is an urgent request to shut off the water on account of a

bursted pipe, when they have a forcible reminder of its necessity."

There were 18,394 places reported to be shut off for non-payment last year, besides 3,634 to be shut off for vacancy, which would also show the necessity of keeping the boxes in sight at all times, and as there are about 50,000 of them, it is quite evident that it will require strict attention at all times on the part of the inspectors to see that they are kept in proper condition.

The following table shows the duties performed by the inspectors of new work during the year 1895:

PLUMBERS AND PLUMBING.

One hundred and twenty-five licenses were issued to plumbers last year. Although they are all required to produce a certificate from the Board of Health showing that they have passed a satisfactory examination—before the Board of Plumbing Examiners—as to their qualifications as a plumber, the number receiving licenses is about the same as the previous year, showing that very few had to go out of business on account of not being able to pass an examination.

The most serious complaints that come from the inspectors against plumbers is that of putting water fixtures in old buildings (such as baths, closets, etc.) without taking out a permit for same. We have found on different occasions that such fixtures have been put in houses without any report being made to this office. They are usually discovered by accident and sometimes not until after they have been in several years, when it is almost impossible to locate the plumber who did the work, as the occupant (if he knows) does not care to expose him, as he has been receiving a benefit through the plumber's neglect. When we discover a plumber who has neglected to make such report, he, of course, has some excuse to offer, such as neglect of his bookkeeper to take out permit, or else claim that it was taken out and through some neglect in this office there was no account made of it, at the same time failing to produce the permit, which would look as though he was the only one at fault.

Our rules provide that a failure to perform work in accordance with them shall subject the plumber, in the discretion of the Board, to a temporary or permanent forfeiture of his license, but the penalty has never been enforced; such complaints are usually against the larger firms and they have little fear of their license being revoked. If it were possible to impose a fine of five or ten dollars for the first offense and have the amount collected before granting them

another permit, I think it would go far toward bringing about a more rigid compliance with our rules. There are undoubtedly many water fixtures in the city to-day, that have been put in old houses, that are not on the assessment rolls on account of the neglect of plumbers in not taking out permits for doing such work and—if the Board have the authority to do so—I think a reasonable fine applied in such cases would have a beneficial effect. With the exception of the foregoing, the plumbers are giving us very little trouble indeed, as a large majority of them seem to have made an extra effort during the past year to comply with the rules governing them, and were it not for a few careless ones, there would be very little occasion for the censure of any.

REPAIRING LEAKS.

Although numerous leaks have been reported during the past year, none of them have been of a very serious nature and all were repaired without difficulty.

The force in this department, under the immediate charge of Foreman Wallace, have performed their work most satisfactorily. It requires much skill at times to repair some of the leaks they come in contact with, and only men that have had much experience in that line of work are able to handle them successfully. Eighty-three leaks were repaired in the main pipes during the year. Twenty-six of them were caused by broken pipes and fifty-seven were leaking joints. Of the broken pipes, twelve were of 4-inch, ten of 6-inch, and four of 8-inch, and of the leaking joints, two were in the 3-inch, fourteen in 4-inch, eighteen 6-inch, three 8-inch, three 10-inch, two 16-inch, six 24-inch, four 30-inch and 5 in the 42-inch pipe. Fifty-five gates of different sizes were found leaking and repaired; 1,379 leaks were found in service pipes, all of which were repaired by owner of premises on which they were located. Three hundred and fortyfive complaints of "no water" were investigated; many of them were caused by frost, and many more from various causes. The water is often let on at the corporation stop and shut off in the cellar in new and vacant houses, and when the tenants move in they complain of "no water" without investigating the cause. We had 83 complaints of "bad water," all of which were remedied by opening blow-off gate and flushing the main. The remedy in most cases, however, is only temporary, as when they are on "dead ends" the same operation has to be repeated quite often. In fact, we have adopted the system of opening all such gates once each month and by doing so we have reduced the number of such complaints very materially. The total number of blow-off gates at the beginning of the year was 521; since that time there have been 68 added, and 30 discontinued. making 559 at the present time. This includes permanent and "dead end" blow-offs. The "dead ends" in the main portion of the city are gradually being done away with, but new ones are being added in the outskirts where it is impossible to avoid making them.

There are many new connections put in on premises where the old one is too small, and where this is done we require the old one to be disconnected (or shut off) at the main, so there will be no chance of it leaking in the future. have much trouble at times in enforcing this rule, as the expense of disconnecting (where it is some distance from the new connection, as is often the case) is such that the owner thinks it is arbitrary on our part to require it shut off on the main, claiming that it will answer every purpose to shut it off at the line of the lot, but if they are allowed to remain in the ground, and shut off at the lot line, it is only a question of time when it leaks, and then we are called upon to repair it. Such leaks usually break out in the winter time when they are the most difficult to locate, as the water often works along in the ground or under the pavement many feet before coming to the surface, and it is sometimes very difficult indeed to find the source from which it comes, making it very expensive, as it necessitutes taking up the pavement in different places, which is an injury to the pavement also. We have had much trouble with old service connections that have been abandoned in years past and allowed to remain without having been disconnected at the main, and we are now trying to prevent future trouble from that cause. In a few instances where there has been asphalt, or new pavement on a plank foundation, making it very expensive to open it, we have allowed the old connection to remain, requiring it to be disconnected at the stop-box, which box must be kept in place so that the service pipe can be located at any time.

There is considerable time lost by the men in this department going to and from much of the work they have to do. For instance: A man is sent to the extreme limits of the city (and sometimes beyond the limits, as there is much pipe outside) and before he gets to the point sent, something else happens that requires attention in the same locality, and it necessitates sending another man very nearly over the same route. As the city covers so much territory it seems to be only a question of time when it will be necessary to establish small sub-stations, say one in the east, one west and one in the northern portions of the city, where the men can be distributed, and attend to the work in the vicinity of said stations, thereby saving much time that is now spent in going to and from those points.

The following table will show much of the work done in this department during the last year:

Attached to this report are a complete list of tools on hand and an itemized account of material in stock in the Meter, Service Cock and Repairing Leaks Departments on the 31st day of December, 1895.

In closing, I beg to thank your honorable body, and the General Superintendent, for the very considerate treatment extended me on all occasions. Also to the heads of the different departments of the Works I am indebted for many courtesies for which I herewith tender my sincerest thanks.

All of which is respectfully submitted.

T. R. PUTNAM, Supt. Meters and Inspection.

REPORT OF CHIEF ENGINEER AT PUMPING WORKS.

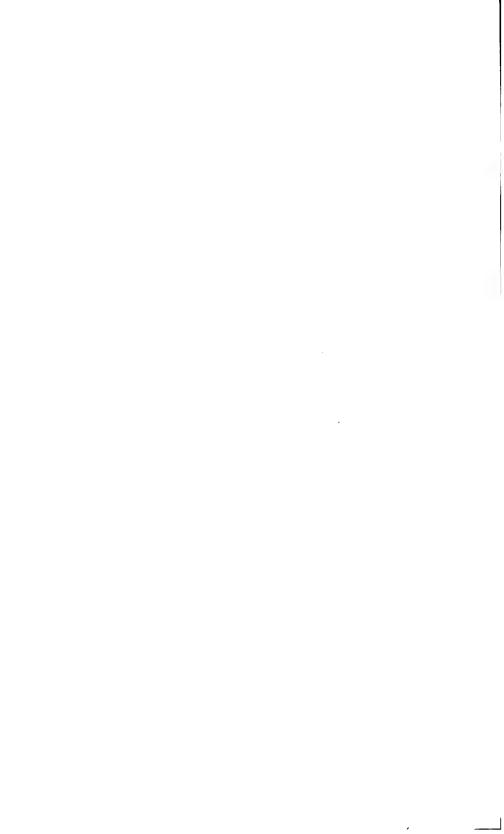

Detroit, January 1, 1896.

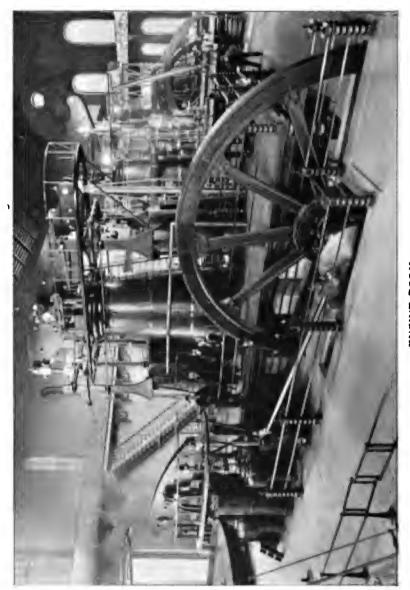

To the Board of Water Commissioners:

Gentlemen—I have the honor to submit the Engineer's report for the year 1895.

The following table shows the number of gallons of water pumped, and cost of fuel for the years named:

YEAR.	GALLONS OF WATER PUMPED.	COST OF FUEL CONSUMED.	Average Daily Delivered.
1869	295,840,971		646.411
1868	808,581,748	\$2,189 87	981.594
1864	870, 765, 196	2.271 84	1,000,806
1855	0.49, 900, 0884	8.825 81	1.487.148

\$51,772 07

Cost of fuel per million gallons pumped has been \$2.18½, and per million gallons pumped 100 feet high \$1.93. Engines Nos. 1 and 2 were run a good part of the year with pumps single acting.

In figuring the cost there has not been any deduction for heating or lighting.

The tables show that the water pumped during the year was 14,698,451,954 gallons. The total expense for pumping water was \$51,772.07, making the cost per million gallons, \$3.52, which is a good showing considering the increased pressure pumped against and also the increased price of fuel. The average head pumped against has been 116.9 feet, while last year it was only 108.4 feet. In fact, if the price of fuel had remained the same as in 1894, the cost per million gallons pumped 100 feet high would have been only \$1.77\faccef{f}, while in 1894 it was \$2.06. There has therefore been a gain at the engines of nearly 16 per cent.

In the last report I recommended the shutting off of the stand-pipe, so we would be able to get additional pressure, which was badly needed; it was in the first part of June when the experiment was tried, and it has proved to be more than what we expected, for we are able to run the engines slower than before, when wanted, and we find that one will not interfere with the other as much as before. As we have made some changes in our pumping engines, it will be of no little interest to describe them, as follows:

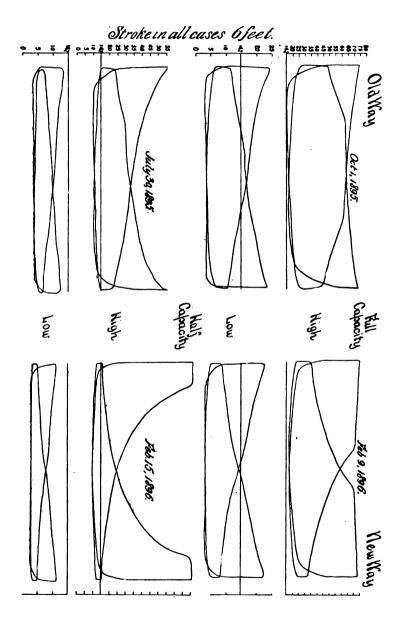

The changes in the water ends of Engines Nos. 1 and 2 were made so we might be able to work our pumps single or double-acting as the case required, without stopping. By referring to gates marked A B B, on page 92, it will be seen that by opening them, the vacuum in the upper half of both pumps will be destroyed, thereby working the pumps single-acting, the gates B B opening into the air and A being on a by pass between the two pumps. This change has also been supplemented by changing the Stevens cut-off on the high pressure cylinder for the Sickles cut-off, and the effects of these changes on the steam consumption is shown by the indicator cards on page 95, and by the following comparative table for Engine No. 2:

FULL CAPACITY.

Old Way.	New Way.
October 1, 1895.	February 9, 1896.
Revolutions per minute 94	
	891 lba.
M. E P.—High, 48.2 lbs.; low, 12.4 "	High, 37.0 lbs.; low, 10.8 "

low, 285.5478.56	
Steam per I. H. P 18.09 "	14.88 **
Gain	17‡ per cent.

HALF CAPACITY.

Old Way.	New Way.
July 80, 1806.	February 15, 1894.
Revolutions per minute 12	10
	56 lba.
M.E.P.—High, 22.8 lbs.; low, 5.9 "	High, 20.7 lbs.; low, 4.9 "
Vacuum	
I. H. P.—High, 158.48;	High, 122.6; low, 97.98230 58
low, 141.53800.01	
Steam per I. H. P 17.83 "	

For the case of "full capacity" the only difference in the conditions was that the old way card was taken with the engine running under throttle, which was necessary at times with the Stevens cut-off, and the new way card was taken with the Sickles cut-off, and the throttle wide open.

In the case of "half capacity" in addition to this difference there was a difference in the water ends of the pumps. The old way was to stop the engine, close the inlet gate, pump out the well, take the covers off the suction boxes and the man-hole of one pump, when we would be ready to open the inlet gate and start the engine again, all of which would take considerable time, and when running, one pump would be working double-acting and the other plunger would be working as an idler, churning the water.

All data except the number of revolutions was obtained from the indicator cards.

While these cards, as shown, indicate a gain of 17% per cent for the new way running full capacity and 17% per cent running half capacity, it is not to be expected that when all the conditions are taken into account, which must be constant under both ways of working, and the additional loss from condensation with the greater expansion, these percentages can be maintained.

But the figures certainly show that these engines are more economical of steam under the new arrangement than they were formerly and that our improvements have contributed to the economy of operation in other ways than by reducing the quantity of water pumped; it is to be borne in mind that these cards represent in no sense test conditions and that they may be improved in the near future.

All of the engines are in good condition, but Engine No. 3 is yet to be changed as Nos. 1 and 2 have been. With all engines changed, and our new boilers, which will enable us to carry a higher pressure of steam, we expect the benefit will be considerable.

Engine No. 4, built by the E. P. Allis Co., of Milwaukee, had its final test beginning June 21 and ending the 27th.

The official duty of the engine as reported by Mr. George H. Barrus, of Boston, was 142,366,443 foot pounds per 1,000 pounds dry steam for the six-day run, and for a 30-day run he figured that the coal duty would be 127,000,000 foot pounds; the engine was at the time running at its rated capacity of 24,000,000 gallons and did its work nicely.

The work of this engine under every day conditions is also highly satisfactory. From a comparison of the yearly records for the two years past with those of the last month, when the oil supplied to the engines has been measured separately, the following approximate results have been obtained of the performance of this engine and the remodeled old engines:

Average cost of pumping per million gallons 100 feet high:	
With old engines 1895 (corrected for heating, etc.)\$1	93
With Engine No. 4	3 2
Gain with No. 431	1/2%
With old engines, 1894 (no correction for heating, etc.)\$2	20
With old engines, 1895 (no correction for heating, etc.)\$2	02
Gain with remodeled engines, about	9%
All figured at cost of fuel for 1895.	

The correction for heating and lighting is made because all the steam so used is taken from the boilers supplying the old engines and all the fuel so consumed is therefore charged to them by the uncorrected report of the measured oil burned. The average speed of Engine No. 4 for the period of the above determination of cost was only about three-fourths of contract speed.

The boilers are in fair condition, although but minor repairs have been made on them this year, but the four in the east room will need some slight repairs soon.

The engine house is in the same condition as formerly, but it must be said that the interior is more comfortable since the introduction of the heaters and in appearance it is second to none.

As the Commissioners are contemplating using coal as fuel, the coal sheds and scales will need some repairs.

Respectfully submitted,
URIAH GOULD,
Chief Engineer of Pumping Station.

Office of Geo. H. Barrus, 95 Milk St., Room 54.

Boston, July 24th, 1895.

Board of Water Commissioners, City of Detroit, Mich., and The Edward P. Allis Co., Milwaukes, Wis.:

Gentlemen—In accordance with your joint request I conducted a six-days' continuous duty trial of the 24,000,000 gallon pumping engine recently erected by The Edward P. Allis Company at the Detroit Water Works, beginning at 10 p. m., June 21st, 1895, and ending at 10 p. m., June 27th, 1895, and I beg to submit the principal results of the same as follows:

I have estimated from these results the corresponding duty based on 100 lbs. of best anthracite coal, as stipulated in the contract, assuming a fair degree of boiler efficiency when using such coal, and I make the duty for a 24-hour test 134,104,023 ft. lbs., and for a 30-day test 127,398,822 ft. lbs., both of which are in excess of the quantities guaranteed by the builders.

A detailed report of the trial is presented in the accompanying pages. I am,

Faithfully yours,

(Signed) GEO. H. BARRUS.

Copy.

ABSTRACT OF REPORT.

NATURE OF GUARANTEE.

In the contract made between the City of Detroit and the Edward P. Allis Company for this engine, the requirements in the matter of capacity were to the effect that the engine should pump 24,000,000 gallons of water in 24 hours, against a head varying from 116 feet to 135 feet, with a piston speed of 215 feet per minute, or 21½ revolutions per minute. The duty requirements were that on a 24-hour test the engine should give a duty of 130,000,000 foot-pounds for 100 pounds of best anthracite coal, and on a 30 days' continuous test,

with steam at 125 pounds pressure and a head of 120 feet, it should give a duty of 120,000,000 foot-pounds.

Considering that the fuel used at the present time, and likely to be used in the future, is fuel oil and not anthracite coal, it seemed inexpedient to make the duty trial under the conditions strictly imposed by the contract. It was therefore mutually agreed between the Water Commissioners and the builders that the test should be made under the present working conditions of the plant, and that its duration be limited to six days, the principal object in view being the determination of the general performance of the engine in the matter of economy and capacity. From the results thus obtained it was decided to estimate the duty realized under the specific terms required by the contract.

DESCRIPTION OF PLANT.

The plant as a whole embraces the engine, which is of the vertical triple-expansion flywheel type, and a battery of four horizontal return-tubular boilers. With the exception of the oil-burning apparatus, the plant was furnished complete by the Edward P. Allis Company. It is operated independently of the remaining machinery at the water-works, although the water is discharged into the common system. The boilers are operated with oil obtained from the Ohio fields, the so-called Reed burner being employed.

The supply of water for the engine is drawn from a pump well in the yard some 20 feet distant from the engine-house, and it discharges into the same force main which carries the water from the other engines to the city service. system here used is that of direct pumping, and the speed of the pumps requires to be varied according to the demand. Moreover, it is necessary, owing to the arrangement of the mains and the exigencies of the service, to maintain a higher pressure during the day runs when the demand is at a maximum, than during the night runs when the demand is re-The changes of speed which are necessitated by these conditions are made by the attendants of the pumping station, who are constantly on watch for this purpose. conducting the duty trial, it was necessary to conform to these circumstances, and consequently the conditions as to water pressure, regularity of speed, and other details of the work which bear upon them, could not be maintained throughout the trial at fixed points.

The engine is similar in general features to the Allis engine at the Milwaukee Water Works, which is fully described on p. 321, Vol. XV., of the Transactions of the American Society of Mechanical Engineers.

The boilers are of the usual form of the horizontal returntubular type, fitted with steam domes. The brick setting differs from the ordinary arrangement owing to the provisions for oil burning. The grates are covered with brick tiling and sand, which is laid over the whole surface with the exception of a strip at the front 4 inches in width. neath the grate the space is divided by means of additional tiling placed nearly horizontally, and the air for combustion is made to pass first to the rear end of the ashpit and then forward above the tiling and beneath the grate before entering the 4-inch opening at the front end. By this arrangement the air is somewhat heated before its supply to the furnace, and its quantity is reduced so as to prevent unneces-At the rear end of the boiler is a hanging bridge wall, and the products of combustion are forced to take a detour beneath it before entering the tubes at the One burner is provided for each boiler. rear end. burner consists essentially of an injector operated by steam. the oil being supplied to the outside of the steam jet. the oil and the steam are regulated by valves. For the purposes of the test the supply of steam for the burners was taken from the other boilers of the pumping station. steam pressure is regulated by adjusting the burners. During the trial it was maintained at practically a constant point.

THE DUTY TRIAL.

The duty trial embraced a complete performance test of the plant, all of the required data for such a test being obtained excepting the quantity of water actually discharged by the pumps. With the system of distribution here in use it was inexpedient, if not impossible, to measure the water actually pumped, except by reference to plunger displacement, and this was the method adopted. The amount of slip in pumps of this design is extremely small (probably not over 1 per cent), and the quantity computed from plunger displacement may be relied upon for all practical purpowes as the actual amount delivered.

In general, the methods followed were in accordance with the recommendations of the Duty Trial Committee of the A. S. M. E. A preliminary test was run under the working conditions of the plant, and during this test, which lasted six hours, the working temperature of the feed water was determined. On the conclusion of this run the jacket water was turned to waste, and the main duty trial was started. All steam and water connections not concerned in the work of the test were first blanked off. The formal trial commenced at 10 p. m. June 21, and continued without interruption and without stopping the engine until 10 p. m., June 27, or exactly 144 hours. Leakage of water and steam into the two boilers not in use, and leakage of the blow-off cocks, was collected from the main blow-off pipe, and its quantity deducted from the feed water as measured. Other accidental leakages which occurred were measured or estimated, and properly allowed for.

During the progress of the trial the quantity of feed water was determined for the whole period of six days. Observations of the principal instruments, embracing steam gauge, water gauge, revolution counter, and readings referring to them, together with some of the other instruments, were made every 15 minutes during the whole trial. The quantity of oil consumed was determined by weight for the first three days, and by meter for the last three days. The quantity of jacket water was determined by weight for the last three days of the test. The calorimeter showing the quality of the steam was operated for a period of two hours once in every eight hours during the whole run. Indicator diagrams were taken from the steam cylinders every hour. Diagrams were also taken from the high pressure pump cylinder nearly every hour during the day runs, and at the same time from either one or the other of the two remaining pump cylinders. Observations of the remaining instruments were made at intervals of half an hour, and, in some cases, one hour, during the trial.

Further particulars as to the instrument and apparatus used, their location, and the method of obtaining data, are given in the full report.

Results.—The principal data and results of the trial are given in the following tables, the first of which relates to the duty and capacity for the whole six days' run. Table No. 2 refers to the work of the steam cylinders and gives the principal measurements and results obtained from the indicator diagrams. Table No. 3 relates to the friction of

the engine and the consumption of steam by the jackets. Table No. 4 gives the data and evaporative results obtained from the boilers.

Following the tables are copies of representative diagrams and a combined diagram, as already noted, together with a chart giving the number of revolutions for each hour during the whole trial, and the pressure in the force main.

The estimate of duty given by 100 pounds of best anthracite coal on a 24-hour test is based on the assumption that such coal has a calorific value of 13.787 British thermal units per pound of coal, and that the boilers on such a test give an efficiency of 75 per cent, or in other words, that they utilize 10.341 heat units per pound of coal, which corresponds to an evaporation of 10.71 pounds of water from and at 212 degrees. The calorific value of best anthracite coal here given is the mean of two of the best results which the writer has obtained from such coal by the use of his coal calorimeter. The efficiency given is not the best that can be obtained from anthracite coal, but it seems to be a fair percentage to be used for the purpose in view. It is not uncommon for boilers of this class to attain an efficiency of 80 per cent.

The estimate of duty given by 100 pounds of coal for a 30 days' test is based on the assumption that the duty would fall 5 per cent below that realized on a 24-hour test. This difference is ample to cover all the necessary losses due to cleaning fires, blowing off, and other exigencies of a prolonged working trial.

The results obtained on this trial will naturally be compared with those of the celebrated Milwaukee test on an engine which, in respect to the steam cylinders, is almost an exact duplicate. The engine at Milwaukee gave a duty based on 1,000 pounds of feed water of 152,448,000 footpounds, and the consumption of dry steam per indicated horse-power per hour was 11.678 pounds. The economy realized on the Detroit engine falls some 7 per cent below that indicated by these figures. A comparison of the records of the two tests shows unmistakably the principal reasons for this difference. The most important of these is the difference in the vacuum in the condenser on the two That at Milwaukee was 13.8 pounds, the temperature of the injection water being 34 degrees, while that at Detroit was 12.4 pounds, or 1.4 pounds less, the tempera-

ture of the water here being 71 degrees. The reduced vacuum counts heavily against the work done by the lowpressure cylinder, being in this case nearly 20 per cent of the mean effective pressure shown by the low-pressure diagrams, and about 7 per cent of the total mean pressure referred to the low-pressure cylinder. In the Detroit engine, owing to less water pressure, the pumps were of larger diameter than those at Milwaukee, and consequently the friction of the engine was increased. According to the records the friction of the Milwaukee engine was 9.2 per cent, while that of the Detroit engine was 10.2 per cent. Furthermore, the Milwaukee engine delivered the water into a reservoir, and the work of the engine was performed under nearly constant conditions of water pressure and speed. In the case of the Detroit engine the head varied from 115 feet to 136 feet, while the engine was proportioned to give the best economy at 120 feet head. This, so far as it acted, was unfavorable to the engine.

It is probable that if the Detroit test had been made in the winter, as was that at Milwaukee, so as to secure the advantage of cold injection water, the vacuum in the condenser would have been equal to that obtained at Milwaukee, and the duty would have been correspondingly increased.

Note. No allowance is here made for steam used by the burners which was supplied by the other boilers. As elsewhere noted, it was found to be 4^{1}_{2} per cent, of the quantity used by the engine. The cost of oil corrected for this amount becomes 92.22, and the evaporation per pound of oil from a temperature of 124.3 degrees, 12.82 pounds.

REPORT OF THE SUPERINTENDENT OF GROUNDS.

To the Honorable Board of Water Commissioners:

Gentlemen—In the philosophy of life, the having done our full duty to-day, ought to bring contentment. But will it?

In these later days, the most energetic men in the fields of art and science strive to reach the very top notch of their ambition, and then are not entirely satisfied, and find satisfaction only in the thought that Rome was not built in a day.

Detroit, beautiful as she is, with her broad avenues, beautiful parks and boulevards, magnificent buildings, endowed by nature with beautiful surroundings, is not yet finished, but is only just begun. Thousands of years hence, when the work is far advanced, perhaps those in charge will then think as we do to-day, there yet remains much to do.

Considering the short time since the improvements of the Water Works Park began, I think we should be well pleased with the progress made.

The thousands of visitors from other parts of the country join with our own citizens in expressing themselves as delighted with the Park.

The improvements now under way, and which are likely to be completed before next season is far advanced, will, in my opinion, add more to the beauty of the Park than any former improvement. Taking down the basin fence and filling in an earth embankment between the basin and canal, in place of the old dock, will have telling effect.

The planting of large trees in the southerly part of the

Park will afford much needed shade, and besides give age and finish to what was a short time ago only marsh land.

The cutting off the piling and lowering all timber below the water, and covering about seven feet of the slope on the west canal bank with cobble stones nicely laid, is an improvement worthy of mention, providing Uncle Sam can be persuaded to stop the drainage of the Great Lakes, which is continually lowering the water level.

Another improvement which will be very much appreciated is the toilet room for ladies.

The improvements now most needed, which I hope your honorable body will soon order, are one team and two foot bridges across the winding canal. Also a good greenhouse, as the houses we now have are propagating houses, and we use every foot of them for growing the class of plants known as bedding plants.

If we had a properly constructed greenhouse that would be ornamental as well as useful, we could have on hand a class of plants we now have no room for, such as palms and other tropical plants; also roses, carnations, etc., which would be an attraction all the year through.

I am glad to say the proper earnings of the Hurlbut estate will likely be sufficient to pay the ordinary expenses of the Park, so that whatever pleasure and satisfaction the people get from the Park will be absolutely free of cost to them. In conclusion would say our stock of bedding plants is in fine condition and we hope to make a floral display next season that will be satisfactory.

I enclose an inventory of the movable property on hand in this department of the value of \$1,400.05.

Very respectfully,

E. A. SCRIBNER, Supt. Grounds

REPORT OF THE SUPERINTENDENT OF EXTENSIONS.

Detroit, Michigan, January 2, 1896.

To the Board of Water Commissioners:

Gentlemen—In accordance with the regulations of the Board of Water Commissioners, I have the honor of presenting to you my annual report, relative to the general condition and progress of the work in this department.

It will be seen by the records of this office that the extensions of the year just closed were less about 16 miles than for the previous year, but if we take into consideration the fact that 2\frac{3}{4} miles of 42-inch main have been laid the past year, the magnitude of this work as compared with smaller lines with the extra labor necessary thereto, greatly compensates for the shortage in mileage.

The extensions of the past year for the replacing of smaller lines of pipe with pipe of larger size, have been about 4 miles only, or about one-third of the length for the year previous, and were largely recommendations of that year, but which were not completed until the past season.

At the close of the year 1894, quite an extensive call was made upon your honorable body by the Park and Boulevard Commissioners, for an extension of distribution pipes along the boulevards; the call covered a distance of about 3^{*}_{10} miles. The desire of the said Board was, that a system of pipeage might be laid to which hydrants could be attached, and set about 600 feet apart, for the sprinkling of the lawns and driveways. There being no water-takers along these proposed lines to be laid, it became necessary, in accordance with the regulations of your honorable body, to impose a bonus, which should cover a certain per cent of the cost

as an inducement to lay the lines of pipe as called for. To meet this an agreement was had, that all common labor necessary for the excavating and back-filling of the pipe trenches should be furnished by that body, the supervision and pipe-laying, including all pipe and materials for the laying of these lines should be met by your honorable body. This agreement being satisfactory, the work was commenced the early part of January of the year just closed. In meeting this call, provision was made by the Engineering Department as to size and location of the same for future use.

In addition to the above, 2,844 feet of 4-inch pipe was laid for the said Park Board for the connecting of their hydrants along the entire boulevards, the total cost of which was met by the same.

NEW LINE OF 42-INCH FORCE MAIN.

The past year has witnessed the completion of this third line of 42-inch main. This makes the third main of this size conveying the supply of water to the city from the pumping works, making a combined area of 723 inches in diameter or a daily capacity of 75,000,000 U.S. gallons. This would seem a sufficiency for some time to come.

Work on the above mentioned main was commenced about the middle of April, working from inside of the grounds of the pumping works and running westerly along Jefferson avenue to Crane avenue, up to which point the line was completed, and from this point the gangs were taken to the westerly end of the line at Champlain and Chene streets, commencing operations working easterly to Crane avenue.

This line was as vigorously prosecuted as opportunity would permit. The section of the line from inside of the pumping works grounds and along Jefferson to Crane avenues, and from this point through private property to Iroquois avenue, a distance of 3,750 feet; the trench was excavated to an average depth of 14 feet. The reason for this excessive depth was to allow this section of the line to

pass underneath the lower or No. 1 42-inch force main and to give sufficient clearance for basement excavations, should it be required to build over where this section of the said main lays.

This line was connected to the 30-inch main in Chene street, at which point a section of the 30-inch main was cut out, and a 42x42-inch Y branch, with 42x30 inch reducers, and a 30-inch gate was inserted; thence from this branch, making an easy radius crossing Champlain street from north to south, the lines then run easterly along the south side of the roadway. From this point to Baldwin avenue the street is paved and on which the Fort Wavne & Belle Isle Company car tracks are laid; coupled with this the contracted width of the street, which is not over 50 feet in width, made quite a formidable obstacle in our way while at work on this line, the traffic of the road being kept open. This section equals about 55 per cent of the entire length, and had it not been for the kind courtesy of the said company and their superintendent of construction, Mr. Hazard, allowing us the use of the south car track, between Elmwood and Baldwin avenues, between which points a double track is laid, it would have been an utter impossibility to have prosecuted the work without a greatly added expense. Notwithstanding this additional space, rendered us by the use of this track, we found our hands full in pushing the work in an expeditious manner. I think I may be at liberty to say right here that it is only just to Mr. August Meike and his corps of assistants having charge of this work to say that in all of the handling of this heavy work not a single accident occurred worthy of mention. 35 branches were set for cross street connections and to which every street having distribution pipe in have been connected, three of the branches have an outlet of 24 inches in diameter: these branches are to connect with the lower or No. 1 42-inch force main that are set at Mt. Elliott, Bellevue and Crane avenues; the one at Crane avenue being connected, the other two will be at some future date.

To this line and along its entire length, including the pumping works grounds, 13 42-inch water gates are set. One of these is a Murdock and 12 the Michigan Brass & Iron Works make.

The apportionment of the length of this line and its location through which it is laid is as follows:

In pumping works grounds, including all connections, 865 feet, or 6 per cent of total length.

Jefferson avenue, from 266 feet west of Cadillac to Crane avenue, 2,109 feet, or 15 per cent of total length, unpaved section.

In line of Champlain street, through private property from Crane to Iroquois avenue, 1,135 feet, or 8 per cent of total length.

Champlain street, from Iroquois to Baldwin avenue, 2,315 feet, or 16 per cent of total length, unpaved section.

Champlain street, from Baldwin avenue to Chene street, 7,879 feet, or 55 per cent of total length; this last section is paved and upon which the tracks of the Fort Wayne & Belle Isle Company are laid.

The principal lines laid in addition to the above 42-inch mentioned were as follows:

Fort street, from Seventh to Tenth street, 12-inch replacing 6-inch pipe; to this a new line of 8-inch in Eighth street and Trumbull avenue were connected; also the 8-inch line in Tenth street. A 12-inch line was laid in Porter street, from the 24-inch main in Tenth street to Fourteenth avenue, and from this point a line of 10-inch was laid to Twentieth street, and still westward in said street an 8-inch line of pipe was laid to Twenty-second street, several short lines of 3 and 4-inch pipe were replaced by the laying of the above.

A 10- and 12-inch line of pipe were laid in Burns avenue, the 10-inch being laid from the lower 42-inch main in Jefferson avenue to the new line of 42-inch main in line of Champlain street, the 12-inch from the new 42-inch main to 8t.

Paul avenue; this line connects the two 42-inch mains at this point.

A 10-inch line of pipe was also laid in St. Aubin avenue from North Boulevard to Clay avenue, this line connects with the 24-inch in said Boulevard.

Frontenac Boulevard, a line of 10-inch was laid on the east side from Mack to Gratiot avenue, and in Hendrie Boulevard, a line of 8- and 10-inch was laid from Collins street 30-inch main to the Frontenac Boulevard, the 10-inch being between Collins street and Mt. Elliott avenue and the 8-inch from this point to Frontenac Boulevard; to the above, all streets crossing the same where pipe had been previously laid were connected.

An 8-inch pipe was also laid in Alfred street from Woodward avenue to John R. street, replacing a 4-inch line. The same size pipe was also laid in Eighth street from River street to Michigan avenue, several short sections of 4-inch were replaced by this. A line of 8- and 6-inch was also laid in Iroquois avenue from the new 42-inch main in Champlain street to St. Paul avenue. The same size was also laid in Joseph Campau avenue, from Catherine to Jav streets: also in Kercheval avenue from Mt. Elliott to Beaufait avenues, this replaced a 4-inch pipe; a short section of 8-inch pipe was laid in Leib street from the new 42-inch main in Champlain street to Monroe avenue, replacing 3-inch pipe; a line of 8-inch was also laid in Maybury avenue, from north of Warren to Stanley avenues; a short section of 8-inch pipe was laid in alley south of Monroe avenue east of Beaubien street; a line of this size was also laid in Park street, from Columbia to Bagg streets, replacing 4-inch pipe, this line connects with the 24-inch main in Bagg street and the 16-inch at the intersection of Park and Columbia streets; a 6-inch pipe was also laid in said street from Bagg to Peterboro streets, replacing 4-inch pipe; an 8-inch pipe was laid in Seminole avenue, from Agnes to St. Paul avenue; also an 8-inch in Trumbull avenue, from Fort street to Michigan avenue, this line connects with the 24-inch main in Abbott

street, and the new line of 12-inch in Fort street; also the 8-inch line in Michigan avenue; 8-inch pipe was also laid in alley west of Woodward avenue as follows: alley north of Jefferson avenue to Larned street, Congress street to alley south of Fort street, and from alley north of Michigan avenue to Clifford street.

The above comprises the principal lines laid, the minor lines with the above appear in the attached list of pipe laid.

PIPEAGE.

The amount of distribution pipe and mains laid and relaid also for private use, and small lines of pipe discontinued during the past year, makes the sum total as follows: Total pipe laid 22 11 18 miles, of which 150 feet were relaid; 1,822 feet for private use and 444 feet laid for blow-offs to connect to sewers; 4 13 10 miles of pipe discontinued, making the net increase of the pipeage 18 1 miles with the works will make the total length 501 1 11 miles with the works will make the total length 501 1 11 miles miles, which in detail is as follows:

Size of Pipe in Inches.	MEASURED LENGTH IN FEET FOR 1894.	ADDED LENGTH IN FEET FOR 1895.	DISCONTINUED LENGTH IN FEET FOR 1895.	TOTAL LENGTE IN FEET FOR 1895.
45	103			108
42	45,207	14,802		59,509
36	715			715
80	49,337		22	49,315

3	78,257	175	2,046	71,386
2	2,820			2,820
Total,	2,550,729	117,887	21,490	2,646,126

Of the pipe laid as appearing in the above mentioned Table of Pipeage, $1_{5\frac{4}{16}\pi}$ miles was laid beyond the city limits, 1,122 feet of which was 4-inch and 4,218 feet of 6-inch pipe; this will appear in the list of pipeage. The total cost of which was met by the petitioners asking for these extensions.

You will see by the perusal of this report no mention is made of log pipe being yet in use, practically it is out; the line in alley north of Grand River avenue, from Lincoln avenue to alley west of same is dead, and that in the abandoned section of Holden avenue, between Second and Third avenues, is still left temporarily in use, two or three service connections still taking supply from it until pipe shall be laid in new location of street.

The following is a table of pipeage as arranged by wards:

TABLE OF PIPEAGE AS ARRANGED BY WARING

It may be of interest to give the location of a number of new streets that have been added to the city, and in which distribution pipe has been laid. The following are the names and locations:

Adele street, west of Chene street.

Burlingame avenue, Woodward avenue to Hamilton Boulevard.

Burns avenue, Jefferson to Kercheval avenue.

Burrell place, Maybury to east of Sullivan avenue.

Chase street, south of River street, outside city limits.

Eastern avenue, east of Twenty-sixth street.

Greeley avenue, north of Alger avenue.

Gillett street, east of Greeley avenue.

Iroquois avenue, Jefferson to Kercheval avenue.

Lawrence avenue, Woodward avenue to Hamilton Boulevard.

Le May avenue, north of Jefferson avenue, outside city limits.

Maxwell avenue, Jefferson avenue to Tonti street.

Moore place, east of Twenty-sixth street.

Newport avenue, north of Jefferson avenue, outside city limits.

Rolf place, north of Mack avenue.

Rollins street, east of Wesson avenue.

Seminole avenue, Jefferson to Kercheval avenue.

Stephens avenue, north of Gratiot avenue.

St. Clair avenue, south of Jefferson avenue.

The following table gives a lucid statement of the average cost of each size of pipe and main as laid, also cost per foot and pro rata of per cent of total cost, of the entire extensions, for the past season's work:

TABLE OF PRO-RATA OF PER CEST. OF TOTAL COST, COST PER FOOT,
AND THEAL COST OF EACH LINE, AS LAID THE PAST YEAR:

24-inch pipe was laid in connection with 25-25 force main, the estimated cost of which is set at 25-25 we \$4.7835 per foot; this amount is deducted from the 19-25 cost of the 42-inch main in making the estimated 25-25 foot, as appearing in the table of cost.

the following pages will be found the Tables of Gates, going number and size in use, number set the past year, number taken out and number reset either for stop or blive offs.

I take the liberty of giving a description of the 42-inch hydraulic pressure gates that have been set in the new line of force main; these gates were made by the Michigan Brass & Iron Works, of this city, and from the general appearance of the same and the apparent good workmanship they have much to recommend them as to quality.

42-INCH HYDRAULIC PRESSURE GATES.

The water gates set in the new line of 42-inch main are operated by hydraulic pressure. They differ from the ordinary kind now in use on our system, in that the screw spindle is replaced by a single piston rod with piston head secured to its outer end, the inner end being secured to the disks; a cylinder is attached to the body of the gate allowing sufficient space between body of gate and inner head of cylinder for stuffing boxes and glands, the gates laying horizontally. The cylinder has a diameter of sufficient area to overcome the friction due the pressure of the water in the mains upon the disks of the gates. Each gate has an 8-inch by-pass attachment, also a blow-off gate opening on under side of valve or disk chamber, for the displacement of whatever of sediment may accumulate at this point, and that would in any way impede the free working of the same. We hope by this method to be able to operate the opening and closing of the valve with less labor and time.

A question arises, however, that when the same has been in use for several years and the lime formation which appears upon the spindles and disks of the water gates, after continued use (which is the chief cause of the gates working hard), will not be the same with the hydraulic piston arrangement. For operating the working of these gates, the men in charge of this department will have to enter the gate wells for working the same, and to see when opened or closed. The gates have a 11-inch pipe attachment to either end of cylinder, leading from both sides of the bypass gate, from which the pressure is applied to the cylinder and to which may be connected any other of the pipeage should it become necessary to do so when the pressure in the force mains is dead. Should we find it still requiring a greater pressure than that upon the mains and distribution pipes to operate the gates, an appliance is had by the attachment of a small pressure pump which will in any event accomplish the purpose intended by this arrangement.

Since preparing this report the 42-inch hydraulic pressure gates have been properly connected to the adjoining main by the attachment of the small pipes for applying the water pressure to the cylinders. The result thus far in operating the gates by hydrostatic pressure is very satisfactory, the time we took in operating the disks was about six minutes, three minutes each way, the pressure being on the main in which the said gates are set from the smaller lines. the direct pressure from the Pumping Works being not vet applied. The closing of the gates may be operated in much less time if so desired by a freer injection of the water into the cylinders. Any greater acceleration of speed than this may, under some conditions, prove to be very disastrous; the quick closing would in all probability cause serious rupture to the mains, but a little common sense will avoid all of this by simply adjusting the discharge leading to and from either end of the cylinder to such a degree that the disks shall not be propelled too rapidly.

I have thought it wise to mention at this point of the report that in speaking of the force mains, I have mentioned the lower as No. 1 main and the line just completed as the new line. Prior to this the line of mains in use conveying the supply to the city have been designated the upper and lower. Now seeing that the said new line is virtually a lower or dual line, would it not now be better to distinguish them by numbering them Nos. 1, 2 and 3 respectively?

PUMPING WORKS.

We are now at work at this point making our final connections with the two lines of force mains and the four engines. When this is completed with all the attendant alterations, the arrangement of this system of force mains will be very complete, working conjointly with or independent of each other. I may add of the above, that had it not been for the unfavorable weather and other causes which I had no control of, I should have been able to report its completion at the incoming of the new year. I hope, however, nothing preventing, I shall be able to report its completion by the next session of your honorable body.

WATER-GATE DEPARTMENT.

The complications incident to this branch of the work and the necessary skillful handling required of the same has been very satisfactorily met under the efficient supervision of Mr. John Bridge and the men in his immediate employ. For the detailed items of this department see appended report.

OFFICE OF EXTENSION DEPARTMENT.

The profusion of clerical work of this department under the efficient supervision of Mr. A. W. Goodsell and his corps of assistants will make a very satisfactory showing of the completeness of the records as kept in this department of the works.

In conclusion, I am pleased to say as in my former report that it would be a breach of courtesy not to mention your kindness and forbearance of the many calls we have had to make upon your attention. I am also pleased to say that the co-operation with the several departments of the works has been of a pleasant character.

Transmitted with this report is an inventory of tools, pipe and specials, office equipments and locations of the pipeage of the city to January 2, 1896.

Respectfully submitted,

HENRY BRIDGE, Superintendent of Extensions.
